Permanence

in Electrical Construction requires
three things:—GOOD { Engineering
Material
Workmanship

You can employ a competent engineer who will
specify good material and make sure you get it.
Your only assurance of getting good workman-
ship is the contractor's past record for doing
high-class work.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

PHILADELPHIA FIRE AND MARINE INSURANCE COMPANY

WE ASK YOU

Isn't it funny?
THAT A MAN WHO CONSIDERS
HIMSELF A BUSINESS MAN
Will get up in the morning
From an advertised mattress,
And put on advertised underwear,
Advertised hose, shirt, collar, tie and shoes.
Seat himself at a table and
Eat advertised breakfast food,
Drink advertised coffee or substitute,
Put on an advertised hat,
Light an advertised cigar,
Go to his place of business and
TURN DOWN ADVERTISING ON THE
GROUND THAT ADVERTISING DOESN'T
PAY!

Now and THEN

What a Difference Thirty Years Make

Do you remember away back when . . . a horse-drawn vehicle, creaking under the tremendous burden of two tons of sand or stone, wended its way at almost four miles an hour?

Compare that picture with present-day

methods of delivery. Now, modern high-powered motor trucks, equipped with specially designed bodies, having capacities several times that of the old wagons, bring your building operation within but a few minutes of our nearest yard.

THE VAN SCIVER CORPORATION

"SELLING POLICIES"

by

PAUL D. CONVERSE

706 page.....6 x 9 inches.....\$5
Published by Prentice-Hall, Inc.,
70 Fifth Avenue, New York.

"Selling Policies" is a new book, dealing with the formulation of sound business policies that relate to the sale of the product. It discusses policies with respect to production and consumer demand. It also describes, in detail, policies covering price, advertising, distribution, credit, and installment merchandising—and kindred topics.

Professor Converse clearly illustrates sound selling policies with 140 practical problems. These policies include all policies regarding sales aside from policies affecting personal salesmen and advertising, although the problems of salesmen and of advertising are touched upon in larger aspects here and there throughout the book. The approach of "Selling Policies" is different from that of any other book of its kind in that it covers a wider scope and deals more with principles.

In discussing the importance of policies, the author points out that "the success or failure of a business venture depends upon the policies pursued and the relative efficiency with which the enterprise is operated. This

volume deals with the former—the formulation of policies—particularly those that relate to the sale of the product. Wise policies and efficient operation are both important. A business may be fairly successful with only one of the two; but to be an outstanding success, under competitive conditions, sound policies and efficient operation are both necessary."

THE ARCHITECT AND THE BUILD-A-HOME-FIRST MOVEMENT

By PHILO R. BROOKE, *Architect*

I welcome the Build-a-Home-First Movement as a means of bringing the architectural world in closer touch with the great public of potential home owners—especially the owners of moderate priced homes. In reaching this result, two things are necessary, the architect must make more of an effort to understand the public and the public must know about architects and architecture. For the time being, I am confining myself to the second of these two objects.

Of course, there is some kind of architectural service back of every home building job, even though the plans came from a plan book or a syndicate sheet. But this, I wish to show, is a long way from having your job planned for you, your lot, your family, your pocket book—by a professional architect who sees the job through to the finish.

In discussing the positive benefits that an architect can bring to a home owner, I hate to speak wholly in financial terms. I would rather talk about the greater and more lasting satisfaction, to the owner and to the community—the fact that a skillful architect instinctively makes each home express something of the personality of the client.

Most owners respond to a little architectural guidance and manifest good taste when an architect explains principles governing the problem of design. Without this guidance, they tend to flounder.

An architect considers harmony with the surroundings, including the size of the lot. He has an eye for shadow lines. He knows whether a cornice is too heavy or too light, the right curvature of an arch, the right slope of a roof, the acceptable pattern for a moulding—details

which mean little or nothing to the practical builder.

Furthermore, he makes these various elements fit into a practical disposition of spaces, correctly lighted and conveniently arranged. One trouble with many plans taken from plan books is that the different floors fail to fit the pictured exterior. The builder is forced to make changes and the whole job is botched.

The small house is inherently a very engaging field for the architect. The beauty of the small house is in its intimacy—its sense of invitation. One typical mistake of the small house builders in past decades was to ape the large imposing mansion, giving the small home as much grandeur as could be contained in a 40-foot lot.

Now the idea is to take the more flexible period treatment, the Tudor, the Elizabethan, the modern English, the Colonial, and perhaps the Spanish—to simplify them and make them so intimate and livable that they seem to reach out and shake hands with you.

One great gain in small house architecture came when the public accepted a certain freedom and irregularity of line, where formerly everything was stiff and rectangular. We have known for a long time that a free hand drawing was more pleasing than a stiffly ruled diagram, yet we held our builders to the diagram idea.

Now architects have taught the public to accept irregular shingle lines, undulating mortar lines in masonry, introduction of field stone with brick, skintled brick work and a variety of rough brick textures, twisted chimneys and roofs which approximate the traditions of thatch, composites of masonry, timber and stucco.

All this has been a tremendous gain, a fascinating vista of interest and pleasure for the prospective owner. But it is a type of treatment that calls for architectural guidance, since, in the hands of a builder untrained in the traditions of design, such treatments are often terrible.

What is the cost, then, of the benefits which an architect confers on a house that a contractor, with a plan book under his arm rarely is able to achieve?

In answering this question I must assure you that I am talking about competent, experienced architects who specialize in small homes. Many architects avoid this kind of work as unprofitable, which is perfectly all right, except that their manner of avoidance sometimes lends color to the belief that architectural guidance is a costly luxury.

Actually a professional architect will frequently (if not usually) build a house for less money than the untaught building contractor. He will draw the plans and specifications, let all the separate contracts, inspect and supervise the work for a fee of six per cent., where the general contractor aims for a profit of ten per

cent. In the former case, the lumber, brick, etc., will be charged directly to the owner, instead of the contractor, but the owner pays in the end anyway and a good architect can buy for an owner quite as advantageously as the builder can buy.

If you want another sordid, practical reason for good architecture it is this—the planned, supervised house will sell for more.

No owner can foresee the reasons which may cause him to place his home on the market. When that day comes will he be selling merely lumber, brick, hardware and construction—all somewhat depreciated—or will he be selling beauty, charm, comfort and consistency? *Architecture, after all, is the most enduring asset in any home property.—Building Age.*

THE TABLOID KITCHEN IS COMING CONSTANTLY INTO LARGER DEMAND

The modern housekeeper is "Fordizing" her kitchen. Beauty of appearance she wants of course—but efficiency above all

The kitchen cabinet was the opening wedge in the development of the modern household kitchen. From the experience which came with its adoption and wider use, women became constantly more and more perceptive of the waste of time, labor and space occurring in the old-fashioned kitchen and of the freedom which modern equipment could provide.

Milady's Time is Valuable

Then came the lure of the motor car, the motion picture, the radio. Milady discovered so many things she wanted to do with her time.

And along with this in the cities came the apartment fashion of living with its economic pressure for the saving of space, making that desirable not only from the

standpoint of saving steps and conserving labor, but also as a means to economy of rents.

The result has been a vast increase in demand for what might be called the "kitchenette" or "tabloid" type of kitchen equipment, not only for the housekeeping apartment in which, because of the limitations of space, the kitchen must be compressed into the smallest possible area, but such kitchens are also favored and wanted by housekeepers even where space is not so major a consideration.

Kitchens That Save Time

The reason for this is obvious. Such kitchens save a vast amount of work and time. The housekeeper has all of her tools and material almost literally under her hands and her work is accomplished with the minimum of exertion and the saving of a vast number of steps.

An Insistent Demand

In this insistent demand for efficiency, however, the housekeeper has by no means sacrificed her desire for attractive appearance. On the contrary she has set a higher standard in this respect as well as in others.

She has demanded and is getting the harmony of attractive color and the appearance and the fact of absolute cleanliness.

Bearing all of these conditions in mind it is not difficult to see why the market for kitchen equipment fabricated from sheet steel is growing by leaps and bounds.

One manufacturer of steel kitchen furniture reports an increase of one thousand per cent in his business in the past few years.

Steel Makes it Possible

The relative thinness of sheet steel compared with its great strength and durability makes possible a large saving in

the space occupied by kitchen units, and provides maximum storage and working room in the least area.

Modern enamel finishes are economically applied to such steel equipment in any desired colors. Such finishes are permanent and have not only the appearance of cleanliness but are most easily kept clean with the least amount of work.

Such equipment is made in separate units, and these can be arranged in any desired formation adjustable to almost any space.

A still further, and from a marketing viewpoint, very interesting development which has grown out of the public's revolutionary methods of housekeeping is shown in the demand for simple compact cooking and kitchen furniture for use in rooms which are not primarily devoted to kitchen use.

One example of this type of product which is finding a large market is the so-called portable kitchen.

In a floor space 30 by 18 inches is provided a compact kitchen suitable for use in apartment hotels, rooms rented for light housekeeping, summer cottages, separate emergency and diet kitchens such as are frequently convenient in hospitals and other institutions.

When not in use it is fully enclosed by the swinging steel doors and its contents entirely enclosed from view.

In addition to storage space for dishes, food and supplies this unit contains a two-burner electric stove which can be operated from a socket connection, and an efficient refrigerator with 25 pounds ice capacity.

It is finished inside and out with lacquer sprayed on a baked base which can be of any desired colors. Stock finishes are white, French gray, apple green and ivory.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

"ANTI-HYDRO" Prevents Brick Mortar from Freezing

All of the brick masonry in this building was laid in mortar mixed with "ANTI-HYDRO". Most of the work was performed during freezing weather.

In addition to preventing the mortar from freezing, "ANTI-HYDRO" also produced a dampproof job and eliminated the possibility of efflorescence and stains appearing on the brick work from the mortar.

Masonry and concrete work started in mild weather, and caught by a sudden cold snap, can be finished during the cold weather, simply by using "ANTI-HYDRO". This insures early occupancy of buildings by owners, or prompt sale, if they are for investment.

"ANTI-HYDRO" is a liquid integral compound. It combines readily with mortar or concrete mixing water. Easy and economical to use. Permanently hardens and waterproofs concrete in one operation. Used continuously for 24 years. Be sure your next job is an "ANTI-HYDRO" job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

As The Editor Sees It

THE estimated cost of all buildings, alterations, repairs and miscellaneous work for which permits were issued by the Philadelphia Bureau of Building Inspection in 1928 was \$111,804,680, according to detail reports printed on other pages of this issue of the GUIDE. The total cost of all building in 1928 in Philadelphia is \$5,416,565 under 1927 which was \$117,221,245. The year 1928 was far below 1926 with a total of building work of \$140,267,200 and a great volume below the record year of 1925 when \$170,913,530 was the total buildings.

The most active branch of the industry was dwelling construction with 7752 houses, costing \$33,655,210; this, however, is a decrease of 1356 houses and \$7,070,275, as compared with 1927 figures when 9108 houses costing \$40,725,485 were built. The average cost of houses in 1928 was \$130.00 higher than in 1927. The past year in no way approaches the record year 1925 when 12,954 houses costing \$70,207,465 were started. The decrease in house building has been offset to some extent by the increase in apartment building which increased in value in 1928, \$5,467,850, although in number of apartments there was a drop of 14. In 1927, 95 apartments cost \$12,-

809,600; in 1928, 81 apartments cost \$17,277,450. In no other class of building has such a large increase occurred. The only other noteworthy increase in the entire classification of buildings was in hospitals which increased from 9 costing \$3,748,000 in 1927 to 14 costing \$5,732,600. A slight drop in the number of office buildings is shown, although an increase in total cost—42 costing \$5,434,125 in 1927 compared to 40 costing \$6,870,365 in 1928.

Schools show a decrease of two but a very large drop—over three million in valuation. In 1927, 22 schools cost \$9,314,825; in 1928 20 schools cost \$6,243,790.

Manufactories in 1928 show a decline of two in number and \$1,090,625 in value. 86 cost \$6,742,075 in 1927 and 84 cost \$5,651,450 in 1928.

Garages dropped from 1658 costing \$5,071,885 in 1927 to 1400 costing only \$3,215,090 in 1928. The number of garages is only 258 less than in 1927 but the decrease in value is \$1,856,795.

June was the largest month in 1928 in point of value of work for which permits were granted—\$15,700,450. The greatest number of operations was started in March—2072.

The record by months for 1928:

Month	Permits	Operations	Estimated Cost
Jan. . . .	557	741	\$ 4,482,600
Feb. . . .	615	1,266	9,157,835
March . .	900	2,072	10,657,745
April . . .	900	1,550	9,161,970
May . . .	998	1,737	13,583,485
June . . .	890	2,049	15,700,450
July . . .	823	1,270	13,378,785
Aug. . . .	788	1,553	11,943,540
Sept. . . .	720	1,065	6,255,770
Oct. . . .	897	1,343	5,735,455
Nov. . . .	717	1,214	6,201,220
Dec. . . .	498	767	5,605,825

Estimated cost for months, 1927:

Month	Permits	Operations	Estimated Cost
Jan. . . .	566	718	\$ 3,254,265
Feb. . . .	777	1,515	7,062,930

Bank Building (alts.), Broadway and Sycamore streets, Camden, N. J. Architects, Lackey & Hettel, 5 Hudson avenue, Camden, N. J. Owners, First National State Bank of Camden, Camden, N. J. Architects taking bids due January 14th.

Road Work, New Jersey. Owners, State Highway Commission, A. Lee Grover, Chief Clerk, Broad Street Bank Building, Trenton, N. J. Route 29, Sec. 5, Ringoes to Mt. Airy, in Hunterdon County. Earth excavation, rock excavation, reinforced concrete pavement, (1) small span bridge. Certified check, 10 per cent. Deposit of \$10. Owners taking bids due January 21st at noon.

F. Ferdinand Durang, Architect, announces the removal of his Philadelphia office to 329 South Thirteenth street, Pennypacker 7026.

Ralph E. White, Architect, has opened new offices at 1518 Walnut street, Philadelphia.

New Jersey Contracts Awarded

Convention Hall and Amusement Pier, Avalon, N. J., \$49,000. Architect, W. L. Gibbs, Jr., Ocean City, N. J. Owners, Borough of Avalon, Avalon, N. J. Concrete block and stucco, 100x136 feet, seating capacity 750. Contract awarded Joseph G. Champion, Tenth and West streets, Ocean City, N. J.

New Junior High School, Thirty-first and Federal streets, Camden, N. J. Architects, Davis, Dunlap and Barney, 1805 Walnut street, Philadelphia. Owners, Board of Education, B. L. Seabrook, Camden, N. J. Electric work contract awarded C. M. Parkhurst Co., Clementon, N. J.

Building (add.), 812 South Fifth street, Camden, N. J., \$3,600. Owner, Gabriel Navarra, on premises. Brick, 2 stories, 16x27 feet, slag roof, hot water heat. Contract awarded John C. Gibson, 527 Cooper street, Camden, N. J.

Miscellaneous Construction News

Swimming Pool and Recreation Center, One Hundred and Thirty-fourth street and Broadway, N. Y. Architect, Edward Schoeppe, 1602 Spruce street, Philadelphia. Owner, name withheld. Reinforced concrete pool, 65x175 feet, locker house, capacity 3,000, sand beach, filtration plant, plumbing, sprinklers, recreation building, size of lot 100x375 feet, refreshment building. Plans in progress. Architect will take sub-bids on foundations and excavation in 10 days. Remainder of work in 3 weeks.

Residence and Garage, Louisville, Ky. Architect, Carl A. Ziegler, 1012 Walnut street, Philadelphia. Owner, Mr. Shackelford Miller, Jr., Louisville, Ky. Brick, white washed, 2 stories, 85x35 feet, 20x22 feet, black Bangor slate roof, hardwood floors, hot water heat, electric light, tile work. Plans in progress.

Plumbing and Sprinklers in Building, Dayton, Oio. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, Leland Electric Co., Dayton, Ohio. Architects taking bids due January 15th.

Apartment, Tenth and Jefferson streets, Wilmington, Del. Architect, Wallace E. Hance, Equitable Building, Wilmington, Del. Owner, name withheld. Brick, cast stone, ar-

Contracts Awarded

Bank, Office and Stores, Ninth and Shipley streets, Wilmington, Del. Architect, E. C. May, DuPont Building, Wilmington, Del. Owners, Farmers' Bank, Third and Market streets, Wilmington, Del. Steel, brick, limestone, 1 and 2 stories, 35x60 feet, 44x100 feet, slag roof, concrete, linoleum, terrazzo or marble floors, hollow tile, metal window guards, metal lath, tile, marble, steel sash, bronze, wrought iron pipe (plumbing, heating, electric separate). Contract awarded John E. Healy & Son, 707 Tatnall street, Wilmington, Del.

Residence, Wawasett Park, Wilmington, Del. Architects, Pope & Manning, Equitable Building, Wilmington, Del. Owner, Edward B. Beale, 2001 Harrison street, Wilmington, Del. Brick, 2½ stories, 35x40 feet, slate roof, hardwood floors, hot water heat, electric light. Contract awarded C. A. Eckman, 821 Orange street, Wilmington, Del.

School Building, Leipsie, Del. Architects, Guilbert & Betelle, Chamber of Commerce Building, Newark, N. J. Owners, State Board of Public Education, Dover, Del. Engineers, Delaware School Foundation, DuPont Building, Wilmington. Contract awarded Hastings & Parsons, Millsboro, Del., \$14,704.46.

De La Salle College, Intersection of Queen's Chapel road, between Maryland and District of Columbia Lines. Architects, Milburn, Heister & Co., Hill Building, Washington, D. C. Owners, Christian Brothers, Calvert Hall, Bal-

timore, Md. Reinforced concrete, brick, granite, steel, 3 stories and basement, gypsum built-up roof, concrete and oak floors, plumbing, waterproofing, architectural terra cotta, electric light, metal lath, tile and marble work, terrazzo work, ornamental iron work, brass pipe, excavation, cement floors, linoleum, elevators. Contract awarded Henry L. Maas, 1119 Ensor street, Baltimore, Md.

(Continued from Page 19)

The following table shows the total for each year back to and including 1909:

Year	Operations	Estimated Cost
1909	17,294	\$ 42,881,370
1910	16,383	37,866,565
1911	16,215	40,030,985
1912	14,907	37,173,635
1913	14,813	38,763,850
1914	15,709	35,419,605
1915	17,712	39,444,125
1916	15,613	49,896,570
1917	8,977	34,016,408
1918	5,950	15,452,670
1919	14,509	65,088,750
1920	12,512	55,305,400
1921	14,654	42,790,780
1922	22,588	114,881,040
1923	21,546	122,650,935
1924	24,234	141,737,460
1925	25,307	170,913,530
1926	19,780	140,267,200
1927	19,527	117,221,245
1928	16,626	111,804,680

The number of garages declined in 1928 as in 1927 and 1926 as shown in the following record for the last 13 years:

Year	No. of Garages	Cost
1915	595	\$ 723,260
1916	878	1,307,340
1917	833	1,296,310
1918	480	833,320
1919	1,322	2,726,540
1920	1,153	2,502,290
1921	1,569	3,505,695
1922	1,909	5,072,765
1923	2,522	5,415,885
1924	2,778	6,951,430
1925	2,381	8,191,025
1926	1,701	5,249,300
1927	1,658	5,071,885
1928	1,400	3,215,090

The Forty-second Ward with 2395 dwellings erected in 1928 led all districts. In 1927 the same ward led with 2552 dwellings erected. The Thirty-Fifth Ward was again second with 2078 dwellings erected in 1928 and had 2402 in 1927. The Thirty-fourth Ward with 559 dwellings in 1928 was third whereas in 1927 this ward had only 302. The Forty-First Ward with 554 dwellings was next with only one dwelling less erected in 1928 than in 1927. The Thirty-Third Ward with 453, the Twenty-second with 395, the Fortieth with 375 came in order named, but all showed declines over 1927.

INDUSTRY TO HOLD GENERAL CONFERENCE FOR CONSIDERATION OF PROPOSED COMMERCIAL STANDARDS FOR FURNACE AND FUEL OILS

A general conference of oil refiners, fuel oil distributors, the manufacturers of oil burning equipment, organized consumers, representatives of engineering associations and other interests, will be held at the Pennsylvania Hotel, New York City, January 9, 1929, beginning at 10 o'clock for the purpose of considering a proposed commercial standard for Furnace and Fuel Oils, according to an announcement of the Commercial Standards Unit of the Bureau of Standards, United States Department of Commerce.

The question of securing the most efficient grade of fuel oil for various types of oil burners is one that is perplexing the manufacturers of oil burning equipment, the oil refining companies, the fuel oil distributors, and most of all, the home owner who pays the bills and experiences the difficulties. In an effort to eliminate much of the misunderstanding and confusion that now exists, the American Oil Burner Assn. has asked the co-operation of the Commercial Standards Unit. This association, working in close co-operation with the American Petroleum Institute and the American Society for Testing Materials, has formulated specifications for three grades of furnace oil and three grades of fuel oil. These grades will be proposed as Commercial Standards for furnace and fuel oil and when accepted by industry, they will become the working basis for the industry, the recognized grades of the refiners, distributors and users.

Knowing that several well defined grades of fuel oil will be in demand the oil refiners can proceed in their operations with confidence. They can store large quantities with assurance of its future demand. The distributors of fuel oil become as thoroughly familiar with the standard grades of oil as coal dealers are with the various sizes of coal, and the oil burner manufacturers can recommend a definite grade for his particular type of burner and the guess-work and difficulties will be eliminated for the consumer. The benefits to be derived from the use of Commercial Standards depend on the degree of co-operation which they receive from elements of the industry, and the function of the Commercial Standards Unit of the Bureau of Standards is to bring about this spirit of co-operation.

When construction of the Chicago Tower starts in February it will be the biggest project in winter building ever undertaken, according to Walter W. Ahlschlager, architect of this new skyscraper, which, when completed, will be the tallest

and largest building in the world.

"Winter building has been general only since 1921," Ahlschlager said, "and while it is becoming more and more common the undertaking of construction of the Chicago Tower in the very midst of the dull building season will be an advance in building methods. Most builders, even now when winter building is common, strive to have a part of their structure under way before the winter season sets in. On our project we will start to build from the ground up in February.

"One factor by which we hope to profit through winter building is in the selection of a building crew. February is a dull month in most of the building trades and we will be able to select a construction crew of the most expert labor. While we will be benefiting ourselves through picking our men we will at the same time be aiding labor by creating a market for employment at a time when the building industry generally is at its lowest ebb.

"It is my opinion that the winter building on the Chicago Apparel Mart will give an impetus to the general tendency towards greater building activity during the winter months and that in the future the whole building industry will become less seasonal."

One who travels much and is observant, particularly if interested in sociological questions, is impressed with the ugliness of our cities—the erratic nature of the skyline, the utter lack of order or symmetry in the arrangement of streets and buildings.

Chicken feathers blown around in barnyards are not lacking in order any more than the ordinary city in its physical arrangement. Here and there you get a block or two that is orderly but for the most part, it is just one grand chaos. On the streets where land is of the greatest value, we have a wondrous collection of shacks and old dilapidated buildings.

Now, as this is a world of cause and effect and we all believe that every effect has a cause, what is the cause or the reason for this chaos? Looking into this matter with any degree of earnestness one must be impressed that it is nothing but the tax system which imposes fines upon those who build and beautify, and offers a reward to those who hold lots out of use for speculative purposes; and if the owners of old shacks that are on valuable land were to tear the old shacks down and put up modern buildings, the taxes we would impose upon them would be so great that between the high capitalization of land and the heavy taxes upon the building, in the run of years they would find it impossible to break even with the open market price of money on the venture.

This is a much more serious matter than most people imagine. It artificially

pushes the periphery of the city away beyond all reasonable bounds, for so much land is held idle in the heart of our cities for speculative purposes that it makes it necessary for capital and labor, in order to get land upon which they can operate and get a return, to go to the extreme outskirts to get cheap land, or land that they can use and still get a market rate on their labor or their capital.

This artificial spreading of the area of a city is disastrous to the budget, for it necessitates streets and roads and lights and schools and other public services spread over a large area. The idle part of this area does not pay in taxes anything like the cost of the social service it gets, therefore necessitating heavy taxes upon improvements. This is the real force that plunges our cities into debt; and a city debt is like a personal debt, a disgrace. In the case of a person, it proves conclusively that he is living beyond his income, in the case of a city it is exactly the same thing. The issue of bonds is merely drawing on tomorrow's income.

Now, of course, it is better to go into debt for schools than to have no schools—it is better to go into debt for sewers than to have no sewers. But there is no necessity to have either debts or no sewers; for nature supplies a revenue, which, if we have sense enough to collect, is ample to meet all the needs of sociological development and that too, without the piling up of debts. City debts really represent the amount of annual economic rent that we give away to individuals who render no service and who deliver no goods, instead of collecting it and with it meeting the cost of our social services. If a man were to give away his income at the first of the year, the only way he could live for the rest of the year would be to borrow or to steal. When a city gives away its natural revenue, there is nothing for it to do, as it must live, but to steal; that is to levy a tax, or to take private property to make good the deficit, or go into debt. In other words, borrow from the future to meet the deficit caused by the stupidity of today.

JAMES R. BROWN.

In the second article of its series of news releases for home owners on "Reconditioning Your Home," just made public, the American Construction Council through its president Franklin D. Roosevelt suggests step by step how to start and what procedure to follow on the reconditioning of a home.

"After giving due consideration to the general factors as discussed in the previous article, the first step for the home owner is to determine whether the location of his home justifies the further expenditure of money. In general, he

should if possible obtain the advice of a reliable realtor, or bank or loaning institution as to all points involved on this. Here the home owner should consider exactly such points as if he were buying or building a house: (a) General surroundings; (b) Drainage; (c) Air and sunlight and freedom from noise and other disturbing features; (d) Availability of public utilities, including electricity, gas and sewerage; (e) Easy access to schools, churches and transportation; (f) Zoning ordinances having to do with restrictions as to kind of buildings that can be put up in the neighborhood; (g) Present taxes and assessments; (h) Character of soil or rock in relation to cost of any necessary excavating; (i) Official acceptance of the street as a permanently improved street, for otherwise the cost of future improving may become burdensome.

"The second step for the home owner is to decide what general *type of alterations* his home will justify. For example, he should decide whether he wants the remodeling to be done in frame, brick, stucco, hollow tile or stone, etc. This step is important in determining many points in his later procedure and should be definitely decided at the start. His decision on this point depends, of course, not merely upon what his personal preference may be, but also upon the present structural nature of his house and what it will best justify.

"The third step for the home owner is to give careful thought to the *layout* of his house in relation to the detailed alterations desired. In this connection he should keep in mind such things as the general size and shape of his house, number of rooms desired and how the old layout can best be tied into the proposed new layout. He should consider these things from four angles: (a) Good structural standards; (b) Economy; (c) Convenience; (d) Appearance. A good design of a house, for example, may be spoiled by not giving the necessary attention to the exposure of such rooms as the living room, bedroom and kitchen. Likewise, the old layout may not permit doing certain things the owner would otherwise like, without sacrificing one or more of the points mentioned. He should also bear in mind what other people may want in case he wishes to sell the house later, for otherwise it may have to be sold at a loss.

"At this point the home owner, if he has not done so before, should if possible employ the services of a reliable architect. The home owner can also get advice from reliable building material dealers or builders or building loan institutions in his community. Various local and national associations of manufacturers and distributors also render valuable service as to the best uses of their materials. Other agencies, such as the Ar-

chitects' Small House Service Bureau of the United States, Inc., and the U. S. Department of Commerce, furnish valuable information in their respective fields. A list of such associations and agencies, with addresses, is obtainable from the American Construction Council. Further detailed information on this as well as later steps to follow in the reconditioning of a home will be given in succeeding "News Articles."

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

Repetition tends to create habit, the more often we see, do or hear a thing, the quicker we are likely to be influenced by it. The consecutive appeal of a number of advertisements will develop certain memories and associations tending to overcome the natural habit of procrastination.—Making advertising pay.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

"ANTI-HYDRO" Lowers the Freezing Point of Concrete to 15° F.

You don't have to stop your Concrete and masonry work during freezing weather if you use "ANTI-HYDRO." All the brick work in this building was laid during freezing weather; results were entirely satisfactory.

"ANTI-HYDRO" is a liquid integral compound which also makes concrete permanently hard and waterproof all in one operation. It is easy and economical to use—simply mix it with the gauging water—no skilled labor required.

During the 24 years that "ANTI-HYDRO" has been in use, it has never failed to produce satisfactory results. Use it on your next job.

Building for Endurance

Construction projects fall into two general
classes, the first comprising buildings that in
but a few years will be torn down and replaced
by more modern ones.

The second class includes subways, large
bridges, monumental buildings occupied by the
OWNERS, etc., all built to last for many
generations.

It is significant that most of our work has
been on jobs in the latter class.

STUCCO**

**INTERIOR
FINISH**

CALIFORNIA STUCCO (Interior)

The Modern trend in interior wall decorations is toward Period finishes and the incorporating of color and texture as an integral part of the wall itself, thus eliminating the necessity for painting and papering. With California Stucco you may finish your home in any desired color and the texture is limited only by the ingenuity of the plasterer applying the material.

California Stucco is of a Keene's Cement and white pure silica sand base, combined with other materials and natural mineral colors, all of which are the finest materials obtainable for the purpose for which they are intended.

A California Stucco wall is not only the modern finish, but also the most durable, economical and beautiful method ever devised for interior decorating. It is marketed by the oldest, most reliable and experienced stucco firm in the United States.

All California Stucco products are now manufactured and distributed from coast to coast and are the generally accepted standard of architects and builders of everywhere.

California Stucco, while exclusive, is not expensive; is equally adapted for interior or exterior to the modest home as well as the finest monumental buildings.

ECONOMY**

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

J., and New Jersey Reformatory for Boys, Mr. Mills, Jamesburg, N. J. Owners taking bids due January 29th.

Garage, Twelfth and Federal streets, Camden, N. J., \$3,500. Architect, private plans. Owners, Sun Oil Company, Finance Building, Philadelphia. Brick, 1 story, 33x55 feet, slag roof, hot water heat, electric light. Permit issued.

School, Collingswood, N. J. Architect, F. Herbert Radey, 428 Market street, Camden, N. J. Owners, School District of Collingswood, H. M. Restrict, 404 Cedar avenue, Collingswood, N. J. Brick, steel, 2 stories and basement, 41x67 feet, maple and cement floors. Low bidder: Hugh B. Miller, Edgewater Park, N. J., \$35,000; heating, Harry Knecht, Collingswood, N. J., \$6,600; plumbing, Harry Knecht, Collingswood, N. J., \$1,345; electric, Fred Boehm, West Collingswood, N. J., \$1,040.

School, Collins Tract District, Pensauken Township, N. J. Owner, Pensauken Township School Board, Pensauken Township, N. J. Work contemplated.

Schools (New laboratories), Collins Tract, Jordantown and Homestead Schools, Pensauken Township, N. J. Architect, Walter Mayo, Pensauken, N. J. Owner, Pensauken Township School Board, Pensauken, N. J. Plans in progress.

Library Building, N. E. Part of Campus, Princeton, N. J. Architect, Charles Z. Klauder, 1429 Walnut street, Philadelphia. Owner, Princeton University, J. Grier Hibben, President, on premises. Stone, fireproof, steam heat, slate roof, electric light. Owner taking bids from Matthews Const Co., Princeton, N. J.

McCosh Hall (class room addition), rear of University Chapel, Washington Road, Princeton, N. J. Architect, Name withheld. Owner, Princeton University, Princeton, N. J. Stone, fireproof, 3 stories, slag roof. Plans in progress.

Variety Theatre, Stores (3), Offices (5), 7th and Kaighn Ave., Camden, N. J. Architect, H. E. Hall, Merchantville, N. J. Owner, I. Mazer, 1533 Wildwood St., (Variety Amusement Co.,) Camden, N. J. Brick, steel trusses, 2 stories, 75x50x170 feet irregular, slag roof, steam heat, wood beam, cement floors, textured walls, roof ventilators, concrete foundations, hot air and steam heat, electric light. Owner taking sub-bids, work to start at once.

New Jersey Contracts Awarded

Residence, Pleasantville, N. J. Architect, H. A. Stout, Guarantee Trust Building, Atlantic City, N. J. Owners, Atlantic County Water Co., 11 Old Turnpike, Pleasantville, N. J. Brick, 1½ stories, shingle roof, pine floors, electric light. Contract awarded Smith & Rider, Absecon, N. J.

Store, 552 State street, Camden, N. J., \$5,750. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owners, Wood Manufacturing Co., 646 Erie street, Camden, N. J. Brick and block, 1 story, 35x60 feet, slag roof, hot air heat. Contract awarded Leon H. Harrington, 203 Springfield avenue, Merchantville, N. J.

Residence, 1237 North Twenty-seventh street, Camden, N. J., \$3,800. Architect, private plans. Owner, John Berson, care of builder. Block, 2 stories, 14x48 feet, slag roof, warm air heat. Contract awarded Henry F. Bowman, 1047 Beideman avenue, Camden.

Road Work, New Jersey. Owners, State Highway Commission, A. Lee Grover, Chief

Clerk, Broad Street Bank Building, Trenton, N. J.

Repairing bridge over main branch of Newton Creek, Connecting Road, Camden Extension, Camden County. Contract awarded F. W. Schwiens, Jr., Co., 90 West street, New York, \$59,934.41.

Route 37, Sec. 3, Lakehurst-Toms River, Ocean County. Contract awarded Fabio Matazzo, 1287 Kaighn avenue, Camden, N. J., \$175,088.67.

Bridges (3) and adjoining road sections, Route 6, Dover Extension Cutoff, Dover, Morris County, N. J. Contract awarded A. Guthrie & Co., Inc., St. Paul, Minn., \$403,690.29.

Route 1 Extension, Secs. 17, 18 and 19, Contract 20, highway from Julia street to Anna street, and from East Grand street to Elizabeth River, Elizabeth, Union County, N. J. Contract awarded Elizabeth Paving Co., Elizabeth, N. J., \$223,513.75.

Store Building, (alts. and add.), 21-25 Broadway, Camden, N. J. Architect, E. J. T. Hoffman, 485 Fifth Avenue, New York. \$20,515. Owners, Schulte-United Co., Inc., 485 Fifth Avenue, New York. New front, new roof, general interior alterations, bond, excavation, shoring, concrete, cement, cement floors, master builders, floor hardener, brick, structural steel, bronze grills, iron window guards, marble, tile, metal lath, plastering, caulking, dumbwaiters, oak and pine floors, copper skylights, metal ceilings, Barrett roof. Contract awarded Minton-Seobell Co., 678 "The Arcade," Cleveland, Ohio.

Office Building (alts. and add.) 702-06 Federal street, Camden, N. J. \$15,000. Architect, private plans. Owner, Raymond L. Warren, 535 Federal street, Camden, N. J. Brick, 2 stories, 16x42 feet, irregular, slag roof, hot water heat. Contract awarded Harry L. Foulkes, 566 Pine street, Camden, N. J.

Building, Rear 2640 Federal Street, Camden, N. J. \$3,500. Architect, Lackey and Hettel, 5 Hudson Avenue, Camden, N. J. Owner, Francis Lynch, 48 South 27th St., Camden, N. J. Block, 1 story, 22 feet 3 in. x 95 feet, slag roof, steam heat, electric work. Contract awarded M. J. Jubanyik, 6th and Penn Sts., Camden, N. J.

Miscellaneous Construction News

Library, East Woodstock, Conn. Architects, Seeburger & Rabenold, 1424 Chestnut street, Philadelphia. Owner, George H. May, The Wellington, Philadelphia. Brick, 1 story, 25x40 feet, slag roof, maple floors. Final plans in progress.

Medical and Dental School, Washington, D. C., \$650,000. Architect, George A. Didden, Bond Building, Washington, D. C. Owners, Georgetown University, Thirty-seventh and O streets, N. W., Washington, D. C. Brick, steel, limestone, 5 stories and basement, 284x100 feet, slate, tile and slag roof, cement floors, cast stone, metal lath, tile work, bond, ornamental iron work. Owners taking bids due January 17th.

Road Work, Delaware. Owners, State Highway Department, Dover, Del. Low bidders:

Contract 114, St. George's-State road, 7.66 miles. Old Line Construction Co., Chesterton, Md., \$359,864.

Contract 103-A (superstructure). Newport Bridge. American Cascale Bridge Co., Wilmington, Del., \$72,000.

Contract 104-A (substructure), Milford Bridge. George Shockley, Rehoboth, Del., \$25,000.

Miscellaneous

Contracts Awarded

Restaurant and Office Building, 488 Eighth avenue, New York City. Architects, Stuckert & Co., 1600 Arch street, Philadelphia. Owners, Bickford Lunch, Inc., 362 West Fiftieth street, New York City. Brick, steel, terra cotta, 3 stories and basement, 24x100 feet, slag roof, interior terra cotta, slag roof, hardwood floors, steam heat, electric light, tile and marble work, terrazzo work, bronze doors and windows, cabinet, mirror, kitchen and restaurant equipment. Contract awarded Kuhn, Smith & Harris, 225 West Thirty-fourth street, New York City, who are taking sub-bids.

School, Leipsic, Del. Architects, Guilbert & Betelle, Chamber of Commerce Building, Newark, N. J. Engineers, Delaware School Foundation, DuPont Building, Wilmington, Del. Owners, State Board of Public Education, Dover, Del. Contract awarded Houston & White, Millsboro, Del. (Note correction.)

GREATEST VOLUME OF CONSTRUCTION WORK EVER WITNESSED IN THE UNITED STATES DURING A SINGLE YEAR WAS HANDLED DURING 1928

BY D. A. GARBER

General Manager

Associated General Contractors of America, Washington, D. C.

Construction operations in the United States leaped forward during 1928 to establish a record which, beyond logical doubt, represents the greatest volume of building ever accomplished by a nation during any single year in the history of the world.

The expenditure for construction of all types in this country last year may safely be estimated at approximately eight billion dollars. The following estimates for distinct types of construction work handled last year are approximated: general building, five and one-half billion dollars; engineering construction, including public works, one billion dollars, highway construction, one billion dollars, and railway construction, one-half billion dollars.

Expressed in terms of dollars, last year's construction work certainly reached amazing totals. But the full significance of the activities of the construction industry during 1928 cannot be found until the results of a study of shipments and consequent consumption of basic building materials are scrutinized.

Viewed from this angle, perhaps the most impressive feature is found in the fact that 1928 was the seventh consecutive year which eclipsed previous annual totals of construction operations. The constant increase since 1921 has served to place the latest annual total upon a level virtually twice as high as that oc-

cupied by the corresponding figure recorded for 1914.

Ever since 1924, the advent of each new year has found many observers declaring a decrease in volume of construction operations to be imminent. Those who made periodic statements that "the peak has been reached" had their eyes upon the pre-war normal volume of construction.

Meanwhile, those who were in a position more closely to study construction conditions, realized that a "new normal" had been established and that no return to the levels of earlier years was possible.

The "new normal" is mainly the reflection of the new American standard of living attained during the last ten years. Additional influences are found in the increase of population and in the tendency of people to drift toward metropolitan areas.

The year 1928 opened with construction activities almost belying the statements of those who felt that the United States was in a position normally to expend approximately eight billion dollars annually for its new projects calling for buildings, public works, highways and railroads. January of last year showed a volume below that recorded for the same month of 1927. When February, March, April and May indicated small inclination to build up activities to the level held by the same months during the preceeding year, it seemed that the construction industry had "reached its ceiling" after a steady six-year climb.

During the first quarter of 1928, however, orders and shipments relating to construction materials reached a volume which definitely indicated that months of the near future would produce activities that would combine to put the year in the role of a record-breaker.

June found all previous figures for a single month exceeded. A slight decline in July was followed by a rise in August. Then came a sensational spurt which sent the September sky-rocketing to a level which astounded even those most familiar with the industry.

From then on to the end of the year, earlier marks fell before the immense volume of activity. The result was that new records for individual months were established eight times during the year.

Special interest centers in the fact that the autumnal and early winter months found operations fighting hard and successfully against the seasonal declines which in previous years had been thought to be inevitable.

The tendency to reduce the volume of "winter lay-offs" formed but a part of the general inclination to rid the construction industry of wasteful practices.

Broad advances were made toward a more general use of standard contract

forms approved by architects, engineers, public officials and contractors. Application of these forms to construction operations repeatedly kept all parties concerned out of legal entanglements by the simple medium of "making everything clear" before work was begun.

A most important action to give the prospective owner "more for his money" was found in the effort to place the construction industry upon a sound credit basis. Until last year, it was possible for almost any man to become a "builder" overnight by the simple expedient of submitting the lowest bid on any job which he fancied to handle.

Practices which are relics of the chaotic conditions existing in the industry during earlier years long had made it possible for "fly-by-nights" to secure construction materials and equipment without more than a fraction of financial outlay. Both the fields of engineering and building construction found determined assaults made upon the practices through co-operative efforts of all elements of the construction industry. While the necessity of making these assaults had long been realized, it remained for the year 1928 to witness the first general effort to place the second-largest industry of the United States upon a business-like basis.

WHAT THE BUILD-A-HOME-FIRST CAMPAIGN MEANS

By E. A. ROBERTS, *Secretary of the Builders' Exchange and Executive Secretary of the Build-a-Home-First Committee*

One of the objects of the Build-a-Home First Campaign is to simplify the task of home building from the standpoint of the prospective owner. To show the importance of simplification, it may be worth while to review the way building operations are organized in Cleveland, because a thorough understanding is the first step toward a solution.

To begin with, there is no such thing as a company manufacturing homes outright, in the same sense that The White Company makes trucks or The Dangler Company makes stoves. A number of independent organizations work on every building, some furnishing material and some furnishing only erecting labor and skill. The most that can be said for those who deliver a completed job is that they supervise and co-ordinate the work of the various trades. In England, I am told, they have general contractors who hire every kind of labor directly, and, in some cases, own their own supply yards. But in America the subcontracting system is almost universal.

When the lot and the money are ready, the next step is to draw the plans, which is the work of an architect. An architect will plan and supervise a house for a fee of 6% of the cost and it is well worth the money.

A possible alternative is to deal with a house building contractor who provides plans as a part of his service. This usually throws the choice of plan upon the owner and makes him the judge of questions of appearance. To employ an architect on the other hand means more definite help in questions of design. In some cases, the architect draws the plans and lets a single general contract to just such a contractor. In other cases, the architect lets separate contracts and supervises all of them.

This latter plan has been followed in building the educational Model Homes under the auspices of the Build-a-Home First Movement, each of which is in charge of a professional architect.

If a general contractor is chosen, either with or without the supervision of an architect, he usually hires one or more trades directly and sub-contracts the work done by remaining trades. Thus a general contractor in house construction is usually a carpenter or mason contractor to begin with—perhaps both. In this case, he must sublet an excavating contract, a plumbing contract, a heating and ventilating contract, an electrical contract, a lathing contract, a plastering contract, a roofing contract, a painting contract, a mantel and tile contract, a decorating contract, a landscaping contract. There may be others, such as a metal window contract. Some sub-contractors sub-let portions of their work. Thus, lathing may be sub-let by the plasterer, asbestos work by the heating contractor, sewer work by the plumbing contractor, and the recital might be much longer.

Material comes from three principal sources. A lumber dealer furnishes the lumber, wall insulation and certain other specialties. The building supply dealer furnishes brick, cement, plaster, metal specialties—in fact all that is installed by the mason and plasterer. Then there is a variety of hardware. Electrical, plumbing and heating supplies come in a class of materials "furnished and erected" by the sub-contractor.

The point is that an untaught owner who tries to guide every detail of a home building project is facing large possibilities of trouble. The fee of the architect, or the profit of the general contractor—if they know their business and do a good job, is usually well earned.

It must be borne in mind that every concern which furnishes material and every man who labors on your house has a "lien" on your property until his bill or

wage is paid. This operates as a cloud on your title and you can neither secure a permanent loan or make a sale until all liens are removed. This puts a severe penalty on unexpected expenses for which you have not provided. Extras are always a source of friction and every possible item should be anticipated in the specifications.

An irresponsible contractor may collect money due on his contract and neglect to pay for material or labor. In this case, your property is held in pledge until these items are paid—which shows why you should choose responsible contractors and sub-contractors.

Building labor is strictly divided into trades and quite thoroughly organized. One of the rules is that union men may not work on the same job with non-union men. Another rule is that a man does not infringe on a job belonging to another trade (except some brief task of less than an hour and disputes sometimes occur between unions as to which shall do certain work. These are called jurisdictional disputes and cause much expense and delay when they occur.

Perhaps I have dwelt too much on the trouble spots in building. The fact that thousands of fine, attractive homes are built every year is proof that there is a way to carry out a building project, like every other project, with economy and satisfaction.

But the Build-a-Home-First Movement aims to increase both this satisfaction and this economy. One thing we are doing is to issue a booklet with plans and illustrations of our five Educational Model Homes, now under construction. The booklet will contain the exact prices of all contracts and sub-contracts, the amount of the architect's fee, the method of financing—how much down and how much per month.

In other words, the booklet will be a complete guide to the duplication of any of these homes on your own lot. It will not be a theoretical price, but a record of actual experience with names of the architects and contractors. If anything, it should be possible to duplicate these homes for less, since an operation can usually be done more smoothly and economically the second time than the first.

Not everyone will want to duplicate these homes, of course. In fact we may erect a greater variety of models next year. Other architects, different designs, different materials, other price ranges will appeal to some owners. But our Educational Model Homes, with their record of established performance and ascertained cost will remain as a sort of yardstick by which other values can be measured.—*Building Industry*.

WHERE WILL THE NEXT CONFLAGRATION STRIKE?

The San Francisco earthquake scattered fire from stoves and boilers, igniting innumerable buildings, but the type of construction, which in many instances permitted the rapid spread of fire, was chiefly responsible for the worst conflagration on record.

Conditions reported in scores of American cities are so dangerous that a spreading fire could quickly develop into a destructive holocaust.

Who can approach a large city at night, viewing the myriad lights rising tier upon tier, without having his imagination stirred by the beauty of the scene? How different, and how terrifying would be the sight, were the magic lights obscured by a raging fire, the entire horizon illuminated by the lurid glare of the flames! And this is no imaginative picture, for the red plague has visited many American cities. Do thinking citizens ask, "Why"?

When medieval Europe was attacked by disease plagues that depopulated its cities, the cause was found in conditions which the people themselves permitted to exist, but medical science has practically eradicated such scourges. In our own country the American people are largely responsible for today's red plague because building conditions are permitted which breed conflagrations. This statement is substantiated by engineers who have studied all the great fires of the century.

Conflagrations are of two principal types: The first is spread when buildings are exposed to radiated heat or actual flames, as in Baltimore, Maryland, and Chelsea, Massachusetts; the second is spread by flaming brands landing on wooden shingle roofs, as in Augusta, Georgia, Paris, Texas, and Nashville, Tennessee, all of which occurred within a period of forty-eight hours.

In the first type of conflagration mercantile and manufacturing plants are usually involved. Heat from the first burning building ignites adjoining or nearby structures, either by radiation or direct flame, and they in turn transmit the fire to other groups. As the fire gains momentum a wave of heat may develop which will make the heroic efforts of the most efficient fire dept. of little avail. Conflagrations of this nature almost burned out of existence the business districts of Baltimore, San Francisco and Chelsea, Massachusetts, and in many of the larger cities of the country the destruction of a block, or the major portion of two or three blocks, has been of frequent occur-

rence. A fire in Paterson, New Jersey, assumed such magnitude that the fire department could not stop its progress and large portions of the manufacturing section were completely destroyed. In many villages and towns entire business districts have been swept out of existence in a few hours. Beach resorts, also, have been subjected to many destructive fires.

Fires of the second class are due entirely to the hazard of the wooden shingle roof, which is a constant invitation to hot sparks. Flying embers falling upon the highly combustible surfaces of such roofs daily cause small fires throughout the country. When only one or two buildings are involved, or when the fire department can reach the scene quickly, wooden shingle roofs are but slight menace, but if fire occurs in a section where there are many such roofs and a brisk wind is blowing, burning brands may be carried several blocks, simultaneously starting three or four fires on different roofs. As the fire department can not, as a rule, fight all the fires at once, control of the situation is lost and large areas become involved.

Both types of conflagration may be present in individual cases, as at Salem, Massachusetts, and Jacksonville, Florida, where the first extensive spread of the fire was the result of sparks on wooden shingle roofs. Later the heat wave of the conflagration swept everything before it; buildings two and three blocks ahead of the actual fire were ignited by the radiated heat. Under such conditions the most powerful fire department is hopelessly handicapped because no effective work can be done in the direct path of the flames. The best the fire-fighters can do is to narrow the path of destruction.

Two Great Fires

In order to report the lessons learned from the conflagrations of recent years, the engineers of The National Board of Fire Underwriters have made an intensive study of each, with a view to helping those interested in improving conditions. These reports have been placed at the disposal of all communities desiring them. The following comment from the report of the San Francisco conflagration cites as noteworthy lessons in conflagration-fighting, the importance of:

1. Front, as well as rear- and side-window protection.
2. Encouraging a measure of individual fire protection by tenants of buildings.
3. Fire-resistive roofs, roof structures and well-protected skylights.
4. Ample water supply and pressure.
5. A large reserve of hose.
6. Fire apparatus of longer range and

heavier caliber. (This apparatus need not be limited by the same conditions of quick response to alarms as ordinary apparatus.)

7. Restriction of the use of explosives in conflagrations.
8. Hollow tile for fireproof buildings and improved sections, giving greater strength to lower webs.
9. Partitions with a better bracing of tile, and fire-retardant transoms as well as doors.
10. Protection to the steel frame in roof.
11. Good brick laying, and mortar with cement instead of lime.
12. Re-enforced concrete and good engineering in its installation.
13. Adopting standards for column protection.

Defective structural conditions were the outstanding features of this report, and so long as they exist conflagrations may be expected in American cities.

Interesting conclusions were also drawn in the report of the Augusta, Georgia, conflagration. It was found that a fire department was unable to control fire in a building of large area and fair height, in which fire could spread from cellar to roof in less time than was required for the department to respond and swing into effective operation. Among the structural lessons were the necessity of eliminating frame additions to brick buildings, protecting exterior and interior wall openings, enclosing vertical openings, and proper construction of parapets, skylights and dormer windows. The report also stressed the inability of a fireproof building to act as a fire barrier, even if unoccupied, unless equipped with properly protected windows; the danger of shingle roofs and the manner in which they spread fires with an ordinary wind blowing, even when the section was not congested and a number of the buildings were brick with non-combustible roofs; the fact that wide streets did not form a fire break when shingle roofs were present. It was also shown that the fire department required an ample supply of water for effective hose streams under maximum requirements, or that all fire companies must be equipped with pumping engines; that outside aid could not arrive in time to be of material assistance, except in case of a second fire, if the apparatus had to come a hundred miles by train; that storing cotton in the streets not only aided in spreading the fire but hampered the operation of the engines.

Is There Danger of Conflagration Today?

After reading reports of conditions which permitted the great fires of the past to rage, one naturally wonders if similar conditions still exist. Many improve-

ments have been made in building construction, but nevertheless conflagrations could occur in numerous cities today. The engineers of The National Board of Fire Underwriters have not limited their investigations to great fires. For the past twenty years they have visited the larger cities of the United States and reported upon the probability of conflagrations. In this way conditions likely to breed sweeping fires were uncovered and a few examples will show how dangerous some of them are.

The report on a large western city, referring to city blocks reads:

These five blocks are compactly built, as 92 per cent. of the area, not including alleys, contains buildings only one of which is of fire-resistive construction, the remainder being of joisted brick or sub-standard mill; six are of excessive height, ten are of excessive area and most of the remainder are of large area. Windows and floor opening protection is almost completely lacking. Occupancies include department stores, stores and hotels, theaters, and large furniture and hardware stores. Although automatic sprinklers are installed in seven buildings, a fire beyond control in any of these blocks could readily involve neighboring blocks, and because of their central location these five blocks are a menace to the entire congested value district.

In two other blocks conditions are such that a fire in either could involve the entire block.

The report on the shoe district of a New England city stated in part:

Owing to the number of large buildings, often with poorly protected openings, the bad cross and angle exposures and some weak walls, the potential hazard is severe.

The absence of rigid inspection, coupled with the hazardous nature of much of the contents of the building, and the frequent changing of the tenant occupancy, increase the probability of fires. High winds are frequent. The water supply is inadequate and the fire department, though fairly efficient, is undermanned—a dangerous combination. However, automatic sprinklers protect 55 per cent. of the area containing buildings and 101 establishments have sprinkler valve or automatic fire alarm systems. While serious individual or group fires are apt to occur among the factories, the danger of a fire getting beyond control is, on the whole, small.

The commercial district includes a long, narrow block of one to six story, small to excessive area, joisted brick and interspersed frame buildings. Along the river are a few large-area frame structures; along one street are grade floor mercantiles, with offices and dwellings above; other occupancies include a department store and furniture stores. An arcade involving a group of twelve buildings or additions forms an excessive fire area of 47,200 square feet; standard protection at communicating openings, where provided, is of little value, for at two such places fire doors were found blocked open and automatic closing devices were defective. To the east are several frame structures which abut a large area, frame and joisted brick department store. The block has good interior accessibility through numerous alleys, but many buildings extend to the river bank and are inaccessible from that side. Window protection is almost entirely lacking, and mutual exposures are frequent. Fire originating in any part of the block could spread rapidly and once beyond control could easily involve a large part of the block and spread across the street, which is only sixty feet wide, the extent depending upon the direction of the wind.

With few exceptions the engineers found similar conditions throughout the central or more congested mercantile districts and in many of the high-valued manufacturing sections of the larger cities. In buildings of ordinary brick construction the joists and floors were largely of wood. The majority had extensive open-stairways and elevator shafts, which act as flues in case of fire and quickly spread the flames to all portions of the building. Few were provided with protection to windows and other opens in walls, with the result that buildings of lower height or across alleyways or other open space, constitute a direct exposure and permit the ready spread of fire from one building to another. Most American cities have narrow streets, which also add to the probability of rapid spread of fire. Few have sufficient fire-proof construction or automatic sprinkler protection in buildings of large area and hazardous contents materially to reduce the inherent hazard of the district as a whole. As a result, in practically every city the probability of a conflagration depends upon quickness in discovering fire, the rapidity with which the fire department gets into action, and the effectiveness of the fire department and the water supply. Failure in any

one of these elements increases the probability of a spreading fire becoming imminent. An earthquake, as in San Francisco, excessive wind conditions, or a multiplicity of small fires such as occurred recently in Washington, D. C., are all conditions which increase the hazard and make the probability of a conflagration such that no American city can be said to be free from it.

On Guard Against Conflagrations

Any one of the major fire catastrophes suffered by America would have left the devastated city crippled for many a year, while some cities never would have recovered, except for the rebuilding power of stock fire insurance. Then, too, the permanent crippling of a community, especially one where manufacturing and mercantile establishments employ hundreds of people, would have a far-reaching and depressing effect on the economic condition of the country. That is one reason why insurance wields a stabilizing influence.

Following the London fire of 1666, which shook the financial structure of England and was succeeded by almost unbelievable hardship and suffering, stock fire insurance came into existence. Most people probably think of it in the light of paying innumerable ordinary losses which occur every day throughout the country, but it also must provide for rebuilding after a conflagration, without affecting the financial status of the individual companies or the economic condition of the country at large. How can an insurance company endure the sudden drain on its resources incident to a great fire? Stock fire insurance companies maintain a surplus to meet serious situations. Their foresight demonstrated its value throughout the past twenty-five years, for the companies provided the factor of financial stability at the time of great disasters. Without a safeguard of this kind new capital would not be brought into the insurance business and its market would thereby be limited, to the detriment of American industry. The significance of these statements will be appreciated when it is considered that the fires of 1904 in Baltimore and 1906 in San Francisco brought losses of \$40,000,000 and \$300,000,000, respectively, to the insurance companies! Under the present plan of operation and distribution of risks, no catastrophe could shake the soundness or the security of stock fire insurance.

Today the companies need ample surpluses to protect the nation's financial structure. The history of fire insurance demonstrates that surpluses were needed in the past. After studying previous conflagrations and applying the knowledge gained to similar conditions found to exist in various cities of the country, the inevitable conclusion reached is that stock

fire insurance must be prepared to stand as a financial bulwark when disaster threatens the nation's stability and prosperity.—*Safeguarding America Against Fire.*

TREATED WOOD IN MILL CONSTRUCTION

Wood in ordinary building construction not exposed to especially severe conditions has an extremely long life, and in many cases is unaffected by decay after more than a hundred years of service. While this is true of certain portions of every wooden building, there are nevertheless certain portions of many buildings where the wood is quite likely to decay in a relatively short period unless protected by preservative treatment.

Untreated wood resting on masonry or in contact with the earth is especially subject to decay because of the retention of moisture at these points and is also subject to destruction by termites in regions infested by these insects. On the other hand, when used for such purposes as interior finish, ceilings, floors, etc., very long life will be obtained in most cases unless industrial conditions in the building contribute to deterioration of the wood. Such conditions exist in paper and textile mills and in plants and factories of various kinds, where the combination of heat and moisture is bound to have a disastrous effect on untreated wood. The enormous amount of timber required annually for replacements in buildings of this kind could be saved in large part by the use of treated timber.

In the more modern industrial plants of this kind timber treated with one of the standard preservatives—coal-tar creosote or zinc chloride—is being used in considerable quantity today for new construction and to replace decayed untreated timbers, but many plants are apparently unaware of the economic possibilities of such construction. The use of treated timber involves but slight expense over the cost of untreated timber, and this is more than compensated for by the longer life obtained and the freedom from labor costs and interruption of work necessitated by repair work or replacement of decayed timbers.

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

Many a man would do a better job if he didn't know about putty.—Ex.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

ALERTNESS PICKS UP ORDERS

Looking for business and just waiting for business makes the difference between success and a bare living.

The DAILY BUILDING NEWS will tell you where to look and make you most alert in securing business.

BUILDING NEWS PUBLISHING CO.
1530 Chestnut St. Philadelphia.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class. Every copy reaches a live prospect.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

"ANTI-HYDRO" Lowers the Freezing Point of Concrete to 15° F.

You don't have to stop your Concrete and masonry work during freezing weather if you use "ANTI-HYDRO." All the brick work in this building was laid during freezing weather; results were entirely satisfactory.

"ANTI-HYDRO" is a liquid integral compound which also makes concrete permanently hard and waterproof all in one operation. It is easy and economical to use—simply mix it with the gauging water—no skilled labor required.

During the 24 years that "ANTI-HYDRO" has been in use, it has never failed to produce satisfactory results. Use it on your next job.

MASTER BUILDERS' PROGRAM OUTLINED

Frank G. Stewart, Newly Elected President, Stresses Necessity of Obtaining Additional Work.

The activities of the Master Carpenters and Builders for the coming year were outlined by Frank G. Stewart, newly elected president, at the annual dinner held in the Manufacturers Club Jan. 16. Methods of obtaining a more satisfactory condition governing the placing of municipal work were considered. Comparatively little of this work is being done by members of the association, which do a business of approximately \$50,000,000 to \$60,000,000 annually in Philadelphia, Mr. Stewart said. This proposition, he assured the members, will be referred to a committee, and with the co-operative effort of the Board of Education a plan will be formed to obtain better conditions in this class of work. An improvement of the method of handling certified checks on municipal work was also suggested.

Architect's contracts were also discussed and a committee appointed to work in conjunction with the Philadelphia Chapter of the American Institute of Architects in drafting a uniform contract. The difficulty does not seem to be with the standard form contract of the American Institute of Architects, but from the additional riders and special contracts printed by a few architects and trust com-

panies, said Mr. Stewart. A standard and equitable form of contract between the general contractor and the sub-contractor will be considered at the same time.

The establishment of a credit service for contractors and builders was also advised by the president. A system whereby the secretary of the company could give immediate information to a member was suggested with the advisability of subscribing to two or more credit agencies for positive check-up purposes.

Another committee was also appointed to investigate insurance coverage and to recommend changes in the present method where fuller protection is deemed necessary.

Among other officers elected were: Barclay White and William R. Dougherty, vice-presidents; Charles G. Wetter, honorary secretary, and Horace H. Burrell, treasurer. The following members were elected directors: Joseph M. Steele, E. P. Flannery, John S. McQuade, H. H. Burrell, E. M. M. Bassett, Thomas Keffer, James G. Roberts, R. M. Peterson, John W. English, Alan S. Cornell, H. E. Curtis, Frank V. Warren and Charles Kessler.—*Public Ledger*.

BUILDING ACTIVITY TO CONTINUE ON LARGE SCALE IN 1929—NEW YEAR MAY EXCEED ALL RECORDS.

By C. STANLEY TAYLOR, *Director of Research, National Building Publications.*

The *Architectural Forum* and its companion publications of the National Building Group have just completed what is perhaps the most detailed and exhaustive survey of potential building activity ever made in this country. If the deductions which have been drawn from a great array of dependable facts and figures are correct, it is quite probable that the year 1929 may prove to be the greatest of building construction years.

In order to explain the basis for some of the unusual phases of this forecast, it may be well to describe briefly the investigating facilities and background which have been employed to develop the figures presented herewith.

For the past seven years *The Architectural Forum* has presented an exhaustive study of the work under way in the architectural offices of the country for the ensuing year. The predictions which have been based upon this annual survey have proved to be unusually accurate in view of the ultimate contract figures developed.

The present forecast is based upon confidential individual reports from the offices of 2,057 architects throughout the coun-

try, covering in detail the work now on their boards or in definite contemplation for contract letting in 1929, plus the information derived through the general building field. The total contact includes well over 150,000 individuals and organizations who are directly interested in various phases of the building industry and a cross-section of whose opinions must have a great bearing upon future activity.

Architects Busiest Year Apparent

In view of the fact that this confidential information from architects has been gathered by the *Forum* for seven consecutive years, it is highly significant to realize that the total contemplated work indicated in this eighth annual survey is greater than ever before in the history of the industry. The accompanying tabulation shows in detail the amount of work estimated to be on the boards of architects for building in the year 1929. This work does not include public works and utilities, but covers only actual building construction as contemplated by various types of owners who make up the clientele of the architectural profession today. Added to this there have been developed figures covering the types of buildings which are not planned by architects, but which in large measure are developed by contractors, engineers, and speculative builders, as explained in detail in later paragraphs.

Thus we find that the first significant fact is the unusual amount of prospective construction reported by the architects of the country.

Conditions have so changed, not only in the building industry, but in our entire commercial life, that the establishment of analytical forecasts cannot be carried out in exactly the same manner as in previous years. The building industry can well be compared to the situation on the stock exchange. Bankers and brokers have given up attempts to forecast the speculative and investment movement of the public by applying measurements of the past, and the reason for this is that so many different new elements have entered the picture that past performances are not sufficient.

New Factors in Building Activity

Similarly we find that new elements have crystallized in the building industry—factors which must change the methods of anticipatory measurement. For instance, the financing of building projects has been placed upon a much better basis of public relationship. There are not only tremendous underwritings of individual building projects being carried out by bankers in our various cities, but building operators have established securities of an investment nature which are even traded in on the stock exchanges of the country. We find the year 1928 showing in the

New York real estate market an actual securities exchange where real estate and building issues are actively traded, making a liquid market for such securities which for many years have carried the aspect of frozen or torpid investments. We find a tremendous number of municipal and state bond issues or other business of public financing being established for the carrying out of school, hospital and public building programs and for the development of airports, which in themselves promise to contribute mightily to the building volume of this country. There may be found in evidence also the consummation of a number of vast development projects and improvements which are opening up tremendous territories for active building construction. The subdivision builders of the residential field are undertaking housing projects almost beyond imagination in their scope. There is under way the most extensive modernizing and remodeling program ever known in the history of this country. This program is being deliberately developed by extensive educational work through building manufacturers, who realize the tremendous size of the potential markets created. Mortgage money, while handled in a manner more intelligent than formerly, is more plentiful than ever before and so many new methods and sources of financing for the building field have been established that no constructive program has to seek very far for its banking facilities.

Coupled with all these factors we have an increasing urge toward building construction by the public whose pocketbook was never so fat. We have a national administration which is known to have a constructive attitude toward developments which involve building and in which there is definite confidence on the part of all elements of the business world. We face several years of obvious prosperity and with no dark clouds threatening any disturbance of a program which promises more comfortable and efficient housing for all types of commercial, industrial and domestic activities.

In January, 1928, we advanced the theory that the several preceding years of great building activity did not represent a "boom period," but that the country and the building industry had arrived at a relatively new normal, augmented by a growing population; the desire for better housing and better buildings for commerce and industry; and by the ability to pay for these facilities.

The actual contract record of 1928 was approximately 5% ahead of the total for the year 1927 and 4% in excess of the total for 1926. These figures include not only building construction, but also engineering work and a considerable part of the volume reported is to be found in the public works and utilities classifica-

tion. On the other hand, the actual building construction has continued in such a volume for five years now that it seems absolutely necessary to discard the "boom period" and to accept the new normal.

Accompanying this article will be found a chart which in graphic form represents a rapid review of several years of building activity. One glance at this chart should serve to indicate the soundness of the "normal" interpretation. The final check on this theory of a new normal condition is to be found in the accompanying forecast of work under way in the architects' offices. Realizing again that this forecast is based on 2,057 individual reports; that it has been established after a very careful correlation and study of the individual sources of information; that it has proven substantially correct for the past seven years; and that no deviation in the method has been undertaken this year, it is felt that the law of averages functions to a point which will show it to be closely approximated in actuality during the year 1929, unless unusual economic disturbances interfere.

The coming years of prosperity will unquestionably see another great uplift in the standards of housing for all types of commercial, industrial and domestic buildings. Our cities, suburbs and rural areas are being drawn more closely together by unprecedented transportation improvements. Our congested central areas are decentralizing for the benefit of

those who desire to live in the suburbs and the country and they are reforming into new types of housing within the cities. Even the tenement districts are undergoing these changes and everywhere there is a change from the old to the new, either in the planning of new structures or the modernizing of old ones.

We are gradually learning better methods of measuring building construction activity in this country. The methods of collecting data and figures are being improved constantly and the facilities for such study are being greatly increased. When we realize that figures of actual records show an annual investment of well over six billion dollars and that there is a tremendous volume of unrecorded construction and of maintenance and remodeling expenditures, it becomes quite evident that we are building well over eight billion dollars worth of new construction annually and that the probable total expenditure in every phase of the building industry is perhaps ten billion dollars a year!

Significant Changes in Building Trends

While every condition points to a continuation of building activity and perhaps the exceeding of all past records to the amount of 4% or 5% for the year 1929, there are, of course, some significant changes. To measure the change of public demand we can compare the percentage figures of our 1928 forecast with those of our 1929 forecast as follows:

Type of Building	Requirements for New Building by Percentages			
	1928	1929	Change	
Automotives	3.9	2.8	—1.1	About 1-3 less
Banks	2.8	2.9	× .1	Slightly more
Apartments	13.2	13.1	— .1	About the same
Apartment Hotels	4.4	4.8	× .4	About 1-10 more
Clubs, Fraternals, etc.	3.5	3.4	— .1	About the same
Community, Memorial	1.5	1.2	— .3	About 1-5 less
Churches	4.3	4.2	— .1	About the same
Hotels	6.9	6.7	— .2	About the same
Hospitals	6.2	4.9	—1.3	About 1-5 less
Industrial	5.3	7.5	×2.2	About 40% more
Office Buildings	11.8	13.5	×1.7	About 15% more
Public Buildings	6.7	6.7	—	About the same
Schools	11.5	11.7	× .2	Slight increase
Stores	2.9	3.4	× .5	About 20% more
Theatres	3.3	3.2	— .1	About the same
Welfare, Y. M. C. A., etc.	2.1	2.2	× .1	About the same

In the field of dwelling construction the reports show less work on the boards of architects at the present time, but two facts must be realized in this connection. First, that a large proportion of projects of this nature were not actually on the boards in December when this survey was made and second, in the field of small dwellings a very large proportion of houses costing less than \$15,000 are not designed by architects. It would seem in this field that there would be built approximately the same volume of residential construction in 1929 as in 1928—per-

haps more and that in the case of houses costing \$50,000 next year will equal, if not exceed, the records of 1928.

It is apparent that these changes in trends of building various types of structures are but a logical reflection of the experience of several prosperous years in the commercial and industrial world. The building industry is apparently to be called upon to provide the facilities for increased production demands and for increased business activity. In the institutional field it is obvious that increased con-

(Continued from page 61)

struction of new hotels should not be expected because in general we have enough space of this character. The hospital field in 1929 is evidently to have a breathing spell in actual construction activity, but it will be a tremendous year of planning to meet great hospitalization programs which are being undertaken by more communities than ever before. The school field shows a steady upward trend which is but natural in view of the expansion of our educational facilities, a condition which always accompanies prosperity.

The prediction of building activity for the year 1929 is presented in detail in the accompanying tabulation. In order to show the changing demand for various types of buildings in different sections of the country and consequently to indicate trends in types of construction, there will be found herewith tabulations showing the relative percentages in the 1929 survey. This represents the splitting up into six sections of the United States the figures already presented for the comparative national analysis.

CITIES BUY VENTILATION IN NEW MOTOR COACHES

Flu Epidemic Revives Clamor For Air Changes in Public Conveyances; Health Leaders Help

The flu epidemic has brought about renewed agitation for efficient mechanical ventilation of motor coaches, street cars, airplanes and even private automobiles in many American cities.

City and state health commissioners, besides the United States Public Health Service, are issuing warnings and asking for laws which will thoroughly protect the health and comfort of passengers who ride in public vehicles, while some prominent manufacturers, sensing the trend, already are providing these facilities.

Of nearly 500 huge motor coaches recently ordered by officials in Toledo, Detroit, Columbus, Cleveland and other cities to supplement street car service, every one is provided with a complete, compact mechanical system of ventilation which is capable of changing the air every three minutes without opening windows or causing drafts. Bad, germ-laden air and disagreeable odors are taken out continuously by blower fans which also pump in fresh air, take it through a heater and distribute it evenly among the passengers. Each of the 120 busses just purchased by the city of Detroit is provided with three ventilators in the roof, one in the cowl and an electric ventilating fan overhead near the door.

Dr. Paul F. Orr, health commissioner of Toledo, has investigated the ventilat-

ing system provided in 200 busses purchased during the last three months by the city of Toledo, besides insisting that this type of ventilation be provided for the city's 300 street cars. He is also making a survey of public schools, hotels, restaurants, theatres and other places to determine the extent to which the systems of ventilation are being operated with the view of immediate enforcement of ordinances which will minimize the risks of the widespread, communicable influenza. Toledo, Detroit, Cleveland, Chicago, New York, Buffalo, Milwaukee, Boston, and Philadelphia theatres are aiding the movement by advertising that elaborate air conditioning systems in their theatres carry out vitiated air continuously and are therefore the furthest removed from the dangers of "catching the flu."

In New York, the subways are equipped with blower fans and other ventilating equipment which are seldom operated. Since the flu struck this great center of population there has been extensive agitation to enforce the continuous operation of these fans. Some of the newspapers are caricaturing foul air in the subway trains and demanding more positive ventilation of the cars. In St. Louis, there has been newspaper agitation for ventilation of street cars. Patrons of the street cars are writing to the newspapers asking for city ordinances providing for specified air changes in these public conveyances. Out in Los Angeles, where the flu had an early start, public health officials declare that poor ventilation of public conveyances was one of the most prolific sources of this baffling malady.

Some of the most observing manufacturers of automobiles are giving increasing attention to ventilation of their products. Several have adopted a new type of hot water heater, which takes hot water from the circulating system of the engine and passes it through the heating element of the heater which is mounted conveniently on the dash under the cowl. Fresh air is driven through this heating element by a small blower fan to all corners of the interior of the car and returned, forming a complete circulation of fresh warm air which will keep the interior of the car snug and warm in the most disagreeable weather.

Several important manufacturers of the cabin air cruisers have given particular attention to the proper mechanical ventilation of these enclosed airplanes as well as other conveniences for the comfort and health of passengers. These features recently were noted in a special report of the Aeronautic Division of the American Society of Mechanical Engineers.

Practically all the quantity producers of automobiles recently have bulletined their dealers and branch service managers to make certain that ventilating sys-

tems are operated during the cold spell which brings with it the menace of carbon monoxide poisoning in closed garages.

You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builder's Guide you should be. The cost is not excessive. A ten spot insures it fifty-two times in the course of a year.

A certain wallboard man advertised in the Guide for awhile and then dropped out. We've had a dozen inquiries since then, asking for his address—every inquiry from a cash buyer. This is a common occurrence. It's hard to make some advertisers see the vital importance of a standing "ad."

You know what propaganda is, don't you? You know, too, how effective a weapon it is, if used properly, don't you? Well, advertising—honest, fair advertising—is the best propaganda we know of. Join the propagandists now! Advertise in the "Builders' Guide."

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship, it is going to miss by just that much the pulling power it ought to have.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right. —John D. Rockefeller.

Man and the giraffe are the only two living things that can't swim naturally. Throw a day-old kitten into the Mississippi and it will paddle its way to shore. The giraffe can't swim because he's not built that way. Man can't swim, just because he is afraid. The chances are that the reason you are not in the swim—financially or otherwise—is because you are afraid.—Glen Buck.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

"Facts are stubborn things." Advertise only the truth about your product and watch the result.

Don't be a Rip Van Winkle. Advertise and let everybody know you are awake and abreast of the times.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

PHILADELPHIA

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

THE NATIONAL BUILDING, BRIDGEPORT, CONN. EDWARD B. CALDWELL, JR., ARCHITECT

T. J. PARDY CONST. CO. CONTRACTORS

"Don't let freezing weather stop your concrete work—use 'ANTI-HYDRO' and keep right on!"

"ANTI-HYDRO" lowers the freezing point of concrete to 15 degrees F. so that work can continue even though the thermometer goes way down. At the same time, "ANTI-HYDRO" permanently hardens and waterproofs concrete mixtures in one operation. Being a liquid integral compound, it mixes easily with the gauging water without the aid of skilled labor.

The concrete work on this building continued right on through freezing weather. Much valuable time was saved and results were entirely satisfactory.

For 24 years "ANTI-HYDRO" has been used on every type of concrete hardening and waterproofing work. Use it for cold weather work. It will save you time and money.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

PHILADELPHIA FIRE AND MARINE INSURANCE COMPANY

Proposals

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., January 23, 1929. Sealed bids will be opened in this office at 3 p. m., March 27, 1929, for the construction (except elevators) of the Department of Commerce Building at Washington, D. C. The building will be approximately 274,000 square feet ground area; seven stories and basement; fireproof construction; stone facing. Not exceeding six sets of drawings and specifications will be furnished to bidders upon application therefor, when such application is accompanied by a deposit of \$200.00 for each set to insure its return. Checks should be drawn to the order of the Treasurer of the United States. All prospective bidders are hereby notified that any bid submitted in response to this advertisement must be accompanied by a statement of facts in detail of the business and technical organization of the bidder available for the contemplated work, including financial resources for such part of the work as is not provided for by the stipulation in Article 16 of the Standard Government Form of Construction Contract to be used, and building experience. The United States expressly reserves the right to reject any bid in which the facts as to business and technical organization, financial resources, or building experience, compared with the project bid upon, justify such rejection. The successful bidder will be required to furnish a performance bond of 50% of the contract price, but in no case less than \$7,000,000. JAS. A. WETMORE, Acting Supervising Architect.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., January 23, 1929. Sealed proposals will be opened in this office at 3 p. m., March 27, 1929, for furnishing all labor and material necessary for a complete elevator and dumb waiter plant in the department of commerce building, Washington, D. C. All prospective bidders are hereby notified that any bid submitted in response to this advertisement must be accompanied by a statement of facts in detail of the business and technical organization of the bidder available for the contemplated work, including financial resources and

building experience, etc. The United States expressly reserves the right to reject any bid in which the facts as to business and technical organization, financial resources, or building experience, compared with the project bid upon, justify such rejection. The successful bidder will be required to furnish a performance bond of 50% of the contract price. Drawings and specifications may be obtained from this office. JAS. A. WETMORE, Acting Supervising Architect.

AS EDITOR SEES IT

The Philadelphia Building Congress Industrial Group Conferences has just issued Document No. 1, "Architectural Woodwork," covering the completed millwork report. This first report of the Industry Group Conferences, if seriously studied and followed, will help greatly in establishment of good local practices. The report is most comprehensive and is a consummation of painstaking efforts on the part of the members of the conference representing the Philadelphia Chapter, American Institute of Architects, the Sash and Door Manufacturers Association of Philadelphia and Vicinity, the Philadelphia Builders' Exchange and Employers' Association, the Philadelphia Chapter Associated Contractors, the Retail Lumbermen's Association of Philadelphia, the Master House Painters and Decorators Association, the Philadelphia Building Congress.

Scope and Summary of the Recommendations

This report constitutes a digest of the agreements arrived at regarding the varied recommendations and suggestions which have been discussed at the many meetings of the Conference and its sub-committees during the past two years, and which have resulted also from correspondence and consultation with experienced architects, engineers, craftsmen and other authorities. While the work embraced the gathering of informative data valuable alike to architect, draftsman, specifier, builder, and millman, it revealed considerable difference of opinion and indicated, as work progressed, the need for such agreement on general principles in order to relieve the confusion, misinterpretation

and irregularity which was found to exist. It also developed the fact that while the conference was called primarily to discuss Millwork the subjects of lumber and the uses of wood as well as priming and painting were so closely allied with good architectural woodwork that the recommendations of the lumber industry and the painting industry were sought and are referred to herein, but will each, it is expected, be more fully covered in later documents.

Structural Lumber and Carpentry

The items which should be specified under this heading and excluded from Millwork are listed in order to conform to local custom. Brief reference is also made to the American Lumber Standards, U. S. Department of Commerce, as a basis for desirable local lumber usage.

Kinds of Millwork

It is worthy of note that the Recommendations in this Document, although emanating from a conference chiefly concerned with Interior and Exterior Millwork produced especially to conform to architects' specifications and details, embrace in addition to such true millwork, interior and exterior stock woodwork and millwork—both available to those erecting buildings with or without the services of architects or of local millmen—in many species and in American Standard lumber and moulding sizes. There is also included recommendations as to species for specific uses in (1) Interior and Exterior Millwork proper, (2) Interior and Exterior Stock Woodwork and Millwork, which are offered not only to provide a reasonable range and variety in the choice of woods, but also to cover use for positions involving special or severe conditions of wear and weathering.

Stairwork Not Included

It is to be noted that stairwork is not included. Stair building, although substantially a classification of general millwork, has developed locally as a specialized craft, and should be specified separately under "Stair-work," including stair carriages, distinct from the Millwork Specifications.

Cabinet Work Not Included

It is also to be noted that Cabinet Work, though possible of inclusion, is not made a part of this Document. When of any considerable extent or specialized nature, it should be classified under a separate heading. Otherwise when included under Millwork, it should be clearly described.

Detail Drawings and Workmanship

Irrespective of the care and choice of species for specific uses, the assembly and installation of millwork when improperly detailed, inadequately specified or in the hands of untrustworthy millmen or workers can be so faulty as to nullify any preconceived superiority of species. On the other hand, proper attention to details and good workmanship can provide comparable service, finish and beauty for any of the woods reasonably appropriate for the position and use.

Economies Through Accurate Estimating

The information supplied by comprehensive details in connection with the estimating drawings not only conduces to economies in estimating, but also tends to make the estimated cost more comparable to actual construction costs. For the reason that such drawings for the estimator as well as for the millworker and erector are too often slighted, and cost "contingencies" thereby developed, the actual value to all concerned of complete details, consistent with the specifications, cannot be over-emphasized.

Small Scale Details

In lieu of full size or large scale details being furnished at the time of estimating the general character of all millwork or special work, even though comprehensively covered by specification, should be indicated by typical details at a scale of not less than $\frac{3}{4}$ " on the working drawings. These should include all features such as door and window frames, doors and sash, eaves, cornices, and other exterior millwork, interior finish and trim, mantels, dressers, cupboards, cases, etc.

Contract Drawings and Specifications

The Contractor for Millwork should have in his possession a complete set of blue prints of the working drawings in addition to all detail drawings for Millwork and related accessories, together with a complete copy of the General Specifications.

Care and Handling of Millwork and Woodwork

All Millwork and Woodwork should be protected from the weather while in transit from the point of production or fabrication to the job; and when delivered at the site should be immediately placed under cover and be well protected from the weather. Such material should not be stored within structures in process of

plastering, nor until such plastering is reasonably dry. Should it be necessary to deliver such material prior to the drying out of the building, a special clause should be inserted in the specification requiring the General Contractor to properly protect the same by tarpaulins or other suitable waterproof cover.

Attention is directed to "Seasoning, Handling, and Care of Lumber (Consumers' Edition)", recommended by the U. S. Department of Commerce.

"Lumber, Carpentry and Millwork"
Classifications by sub-divisions

With respect to the lumber and millwork to be employed in a structure, the following sub-divisions of the specification on "LUMBER, CARPENTRY & MILLWORK" are recommended:

- A—Structural Lumber and Carpentry;
- B—Interior and Exterior Millwork (Architectural Woodwork);
- C—Interior and Exterior Stock Woodwork and Millwork;
- D—Stairwork;
- E—Cabinetwork.

Each classification should be, wherever practical, specified separately under its own heading. Obviously, however, when but few items of stock millwork are to be included they may be combined with one of the other sub-divisions.

A. Structural Lumber and Carpentry

This shall include all rough and surfaced lumber such as needles, shoring, timbers, piles and piling, posts and forms, columns, girders, beams, joists, rafters, plank, sub-flooring, sills, studs, plates, girts and caps, furring, grounds, bucks, sheathing, roofers and lath. (Siding, ceiling, flooring or other finished items normally carried as stock by lumber dealers, are referred to under Classification C.)

Grades and Sizes

All lumber and the heavy timber should be specified in terms of commercial grades conforming to the basic grading provisions, and in the sizes given in the last edition of American Lumber Standards, U. S. Department of Commerce Simplified Practice Recommendation No. 16—"Lumber"; copies of which may be had by addressing the Congress, 705 Otis Building, Philadelphia.

B. Interior and Exterior Millwork
(Architectural Woodwork)

This shall include all architecturally designed members and assemblies in wood essential to appearance, enclosure, utility and similar purposes, other than items mentioned under Classification A, and other than "stock" items later listed under Classification C.

Seasoning

All interior millwork should be kiln-dried; exterior millwork may be either

thoroughly air-dried or kiln-dried. (Preferably air-dried.)

Sizes and Shapes

The dimensions and patterns of interior and exterior millwork should be clearly indicated in the specifications and shown in the detail drawings. The nominal and dressed sizes of all detailed millwork in the Philadelphia District should conform to the American Standard "Industrial" thicknesses and widths, as follows:

1"	nominal to finish, dressed, 13/16"
1 1/4"	1-1/16"
1 1/2"	1-5/16"
2"	1 3/4"
2 1/2"	2 1/8"
3"	2 5/8"
4"	3 5/8"
6"	5 5/8"

Kinds and Quality of Woods

The wood to be employed for all interior and exterior millwork, such particularly as finish, trim, window and door frames, sash and doors, cornices, built-up and solid columns, etc., should be clearly described by the specifications or on the detail drawings, or both, preferably allowing comparable choice in accordance with the Table of Specific Purposes in these Recommendations, and the "defects" and "blemishes" permissible for the specific uses may be as follows—unless otherwise stipulated:

- 1—The visible portions of all interior or exterior Millwork that is to be painted may contain small surface checks (maximum length 4"); pin wormholes (maximum diameter 1/16"); slight (removable by hand) machine defects; sound, tight pin knots (maximum diameter 1/2"); small pitch pockets or streaks maximum length 2"); and light stain.
- 2—Woodwork when not visible, such as backs and insides of window boxes, backing of door frames, etc., may contain, in the interest of economy and conservation, defects which are not permissible in visible work. In cases where interior or exterior Millwork is to be stained or natural finished, only such defects and blemishes should be allowed as will not detract from the finished appearance. Sapwood should be prohibited for exterior woodwork exposed to the weather when either painted, stained or left natural. Bright sapwood for interior work is no defect, but in species where sapwood stains are not removable by machine all such wood shall not be used without specific approval of the architect. In those woods having a marked difference in color between heartwood and bright sapwood, specifications should state whether unselected or, if not, which is required.

Built-up Columns

For exterior built-up, specially detailed, columns, it is essential that the wood should be selected for durability of species, such as heart white pine, heart red cypress or heart yellow poplar. As in the case of very large columns, a clear stock would mean great expense, the architect should use his judgment as to whether or not he will specify "small tight knots no defect" accepting such knots up to 1" in diameter and not too close together.

Exterior Hardwoods

In the use of hardwoods for exterior work, the architect should give heed to their behavior under various weather conditions and consider their characteristics such as checking, warping and twisting as well as the proper use of weather resisting varnish. Of all the hardwoods in use, the white oaks have the greatest resistance to decay. However, if white oak is used, it should be especially well seasoned, remembering also that the thicker the wood the longer it takes to cure and the more readily it checks.

When door frames are made of oak or other hardwood the thickness of this wood should not be more than $1\frac{3}{4}$ " and if thicker a backing of other wood should be used.

Veneered Exterior Doors

Should the architect decide to use exterior veneered doors, then the veneer should be at least $\frac{1}{4}$ " thick and should be put on with water resistant glue. Such doors should be so detailed that all members will shed, and not retain water. All edges of doors should be protected as described under Painting and Varnishing on Page 8. In the case of exterior veneered doors it is even desirable to protect the top edge by metal. In this connection the practice of the Philadelphia Board of Public Education is of interest, the following being quoted as its specification requirements "The top edge should be covered with a copper weather cap (furnished by the Hardware Contractor), the same being formed with sharp corners, the exact thickness of the door, completely covering the full width of the door on top and $\frac{3}{4}$ " down on each side and ends, where it shall be turned into recess in door and fastened with small brass screws spaced 4" on centers."

Construction of Sash for Exterior Windows

It is best practice to mortise and wedge all rails through stiles and to double pin all corners, also to mortise and pin vertical mullions to rails and to white lead or glue joints of sash and muntins, before assembling, as a preventative against decay. When an architect specifies, or a purchaser stipulates, that "Recommendations of the Philadelphia Building Congress Document No. 1 on Architectural Woodwork shall be followed," it will

mean that no less secure method of putting sash together will be acceptable.

For additional strength it is recommended that a lug or drop be provided at bottom rails of upper sash or the meeting rail dovetailed into stiles.

It is also recommended, where sash locks are to be installed, that stops be specified to be placed in the top of pulley stile at either side thus preventing the sash lock from marring the inner head of frame when lower sash is raised full height.

When weatherstrip is not specified the underside of the bottom rail of the lower sash should be grooved or rabbetted over the lip of the sill, or otherwise so detailed and made as to afford a break against water penetration.

Window Sills and Tongued Casings

All sills for window frames of a sash width of 3 feet 4 inches or over should be $2\frac{5}{8}$ " finished thickness. Sills for smaller windows should be $1\frac{3}{4}$ " finished thickness unless required to be thicker to conform in appearance, to adjacent frames. The underside of all wood sills should be ploughed or grooved and be backed with masonry as soon as the frame is leveled and set.

The tongues on all casings when let into jambs should be $\frac{3}{8}$ " and the jambs ploughed sufficiently to receive same.

Wind and Water Breaks

If window boxes in "plank front" construction are not detailed with the outer or inner lining projecting into the masonry, other provisions should be made with $\frac{7}{8}$ " by $1\frac{5}{8}$ " wood strips nailed on backs of such boxes and on door frames, or metal fins may be shown and called for specifically—either under millwork or under metal work, for interrupting the free passage of air and water by this means, plus mortar applications. These methods will effect considerable saving of fuel and add greatly to comfort.

Window Boxes and Sash Weights

Many architects or millmen have at some time in their experience been called upon to substitute lead weights for cast iron in window boxes which have been detailed or made too small for adequate weights of iron. This should not be the case with proper knowledge of the circumstances.

The maximum standard sizes of flat cast iron sash weights are: $1\frac{1}{2}$ "x $2\frac{1}{4}$ "x36" and the dead weight is approximately 30 lbs. Therefore for all large or heavy sash the depth of weight pocket should not be less than $2\frac{1}{2}$ " and the pulley stile opening to pocket should be at least one-third ($\frac{1}{3}$) of the height of the window opening.

Staff Beads and Calking

To accommodate calking between "staff beads" or "reveal moulds" and masonry

jambs it is recommended that details show special grooves or ploughs for this purpose or indicate that such moulds are to be secured at a sufficient distance from the masonry to allow for calking, which cannot be properly applied otherwise. When spaces between boxes and masonry are to be packed or calked the fact that staff moulds are to be loosely attached for later removal should be covered in the specifications for Carpentry and for Calking as well as under Millwork and Painting and provision be made for the re-applying and re-nailing of mouldings by the Carpenter before final painting.

Sash Pulleys

Care should be taken in mentioning whether sash pulleys are "stock" or "special." It is the custom of local mills to include stock pulleys only. When special pulleys are intended they should be specified under "Hardware," but a reference to this fact should be inserted in the millwork specifications.

Plastered Jambs and Plaster Grounds

When the window jambs or door jambs are plastered into the frame, or casing, this fact should be mentioned in the millwork specifications as well as under Plastering, in addition to being shown on the detail drawings.

All plaster grounds, (which are items of carpentry and not millwork), should be detailed and set back $\frac{1}{2}$ " from outside edge of door and window trims and $\frac{1}{2}$ " below the top edge of bases, etc.

C. Interior and Exterior Stock Woodwork and Millwork

This shall include all flooring, siding, ship-lap, ceiling, tongued and grooved boards, or other items normally carried in stock by lumber dealers, and not architecturally designed as millwork proper.

Grades and Sizes

The quality and size of interior and exterior Stock Woodwork and Millwork should be described in terms of American Standard Association lumber and moulding grades, sizes, designs, and patterns, the grades to be determined by whether the wood is to be painted or finished natural.

Seasoning

All interior Stock Woodwork and Millwork should be kiln-dried; exterior Stock Woodwork and Millwork may be either thoroughly air-dried or kiln-dried. (Preferably air-dried.)

Thickness

The dressed thicknesses for all Stock Woodwork should be not less than the "Commercial" thickness prescribed by the American Lumber Standards, which is $\frac{1}{32}$ " less for one inch than the "Industrial" thickness referred to previously.

Stock Finish

The sizes and designs of Stock Trim and Mouldings should be in accordance with the American Standard 7,000 Series.

Painting and Varnishing of Millwork and Woodwork

All exposed knots in interior and exterior Millwork and Woodwork should be well shellacked before painting. All interior Millwork to be painted should be given one coat of shellac, especially so for resinous woods or when poplar is used—with white sap no defect. All outside woodwork to be painted should receive not less than three coats of paint of the quality called for by the painting specification, and all interior work not less than two coats of paint of the required quality in addition to priming.

The top, bottom, and edges of exterior and interior doors should be thoroughly painted or varnished using waterproof paint or varnish for exterior doors and for interior doors in basements or places where dampness might be encountered. Parts of Millwork inaccessible when in position such as the backs and sides of window frames and solid door frames, the undersides of all sills, etc., or woodwork in contact with plaster or masonry, should be thoroughly painted—preferably two coats—before placing.

All surfaces to be painted should be thoroughly dried to avoid subsequent blistering and/or discoloration. Painting should not be done on frosted surfaces, nor during inclement or excessively humid weather.

Because of the tendency of the grain in some woods, such as fir or cypress, to raise if subjected to humidity before paint or other finish is applied, it is important that no time should be lost before the first coat of paint or finish is applied to such woods at the mill or at the site. Because of the objection which has been brought forward by some regarding the tendency of paint to peel from certain woods, such as cypress, when used for exteriors, it is recommended as an easy remedy that a highly solvent or penetrating liquid be applied to cut the sap or grease in such woods. For this purpose, the priming coat should contain 15% liquid amount of toluole or benzole, with the usual amount of drier. Yellow Pine or Long Leaf Pine containing an excess amount of rosin should be treated in the same manner.

To the conference representatives and compilers of this Document, the difficulty has been apparent of so preparing the recommendations which it contains that they will be fully applicable to all local conditions and to materials available. As now submitted, it is hoped that they will not only afford the basis for a better understanding of good millwork and of conditions surrounding estimating, manufacturing and installing of same at the pres-

ent time, but be the means of developing further improvements in the future.

All users of this Document will confer a favor upon the Conference and the Congress if they will report any disagreements or omissions or make suggestions for better methods or means of stipulating any of the recommendations which may develop through their experience in the use of this Document. Any corrections or improvements which the practical application of this Document may disclose as desirable may be included in any subsequent edition. All such suggestions and requests for copies should be addressed to

H. J. BARINGER,
Secretary Philadelphia Congress,
705 Otis Building, Phila., Pa.

Tables of specific purposes and kinds of species recommended for interior and exterior millwork (architectural woodwork) are a vital part of the Conference reports and will serve a most useful purpose.

DOMESTIC AND FOREIGN TRADE
OUTLOOK

By DR. JULIUS KLEIN, *Director, Bureau of Foreign and Domestic Commerce, Department of Commerce*

The year 1928 closed with domestic business larger than ever before and foreign trade in exceptional volume, and there is every indication that the high levels of recent months will be carried into the New Year. The output of farm crops during 1928 was about 5 per cent. larger than in the preceding year, and industrial production showed an even greater increase. Exports of merchandise were larger than in any year since 1920, exceeding five billion dollars.

The automotive and construction industries continued throughout 1928 to be the back-log of America's prosperity. Automobile production was larger than in any earlier year and contracts for future construction showed a substantial growth. The activity of these industries has resulted in a greatly increased demand for many related products such as steel, cement, rubber tires, and refined petroleum.

The heavy outflow of gold in the first half of 1928 resulted in a considerable change in the money situation. Partly as a result of this reduction in our gold stock but more largely as a consequence of the extraordinary activity of the stock exchanges, rates for call money and for stock-exchange time loans advanced sharply. Bank credit for commercial purposes, however, has continued in ample supply at rates only slightly higher than a year ago; while open market rates for commercial paper have shown a somewhat greater advance.

Wholesale distribution showed little

change in volume, but sales of many different types of retail establishments increased in 1928. Sales of mail-order houses and various kinds of chain stores had a particularly large growth but this was partly due to an increase in the number of stores operated. Department store sales also increased and there was a considerable reduction in the size of their inventories.

Further progress has been made in the elimination of waste and in the increase of business efficiency. During recent years there have been marked increases in the per capita output of the manufacturing industries and of agriculture and efforts are now being made to improve the efficiency of distribution which is still relatively wasteful.

There has been no considerable accumulation of stocks of commodities, and the general level of wholesale prices has shown comparatively little change. Increases in prices of hides and leather, food, building materials, metals, and fuel and lighting slightly more than offset declines in prices of other groups of commodities.

Wages continue at a high level, and the unemployment which was noted in the early part of 1928 has been reduced to a minimum. Factory employment was increased for the first time in a number of years; gains were particularly noteworthy in the automobile, rubber tire, iron and steel, petroleum, and nonferrous metal industries. Mercantile establishments, hotels, and the automotive distributing and service industry also absorbed many additional workers as in other recent years.

The great increase in production and sales of automobiles during the past year has had far-reaching effects on many other lines of domestic business. The automobile has been the most important single factor in the expansion of our export trade. A total of over four and one quarter million passenger cars and trucks were produced in 1928, which was about one-fourth more than in 1927. It is an indication of the yet unsatiated demand for automotive vehicles both in this country and abroad. There were also marked increases in output of rubber tires, gasoline, steel sheets, and many other industries which sell their products to automobile manufacturers or car owners.

Construction operations which declined slightly in 1927 showed another large expansion during the year just finished. Contracts for new construction increased in value by almost 7 per cent., as larger awards for residences, industrial buildings, Public Works and Utilities and Educational Buildings more than offset the decreases in other types of construction. These expanding operations resulted in a larger output of structural steel, brick,

cement, and many other building materials. Lumber cut, on the other hand, decreased for the third successive year.

The iron and steel industry reflected to a marked degree the stimulus of increased demands from building contractors, automobile factories, and manufacturers of many types of machinery. Prices showed a moderate advance and output of crude steel, sheets, structural shapes, and many types of finished products was substantially increased. Unfilled steel orders were higher in every month than in the corresponding period a year earlier.

The copper industry which has been undergoing a prolonged period of readjustment in recent years, partly a result of after-effects of the war and partly caused by improvements in technical processes, had a marked recovery during 1928. Copper prices advanced steadily throughout most of the year and stocks of refined metal were greatly reduced. Production of smelters, and refineries was larger than in any earlier year.

Agricultural output has shown almost as great an increase as manufacturing during the past year. The total land used for all crops harvested was larger by about 8,000,000 acres than in 1927 and the aggregate production increased approximately 5 per cent. The average of farm prices showed little change; prices of meat animals, dairy products, and poultry products advanced, while quotations for grains, and fruits and vegetables receded.

Although the textile industries as a whole have failed to share in the widespread prosperity during the greater part of the year, signs of increasing activity became evident toward the close of the year. Prices of textile products showed a moderate recession during 1928 and mill consumption of both cotton and wool declined as compared with 1927. Silk mills, on the other hand, were somewhat more active.

The world-wide improvement in business conditions in recent years is indicated by the steady expansion in the exports of other nations which has rather closely paralleled the growth of our own trade. The combined figures of 10 leading European countries for the first nine months of 1928 show an increase of 5 per cent in value of exports as compared with the corresponding period of 1927. The fact that this expansion is relatively greater than that of the exports of the United States is evidence of the further economic recovery of Europe. Of the 10 countries, only Sweden and Finland had smaller exports than in 1927. Germany's trade showed an especially marked growth.

The exports of countries outside of Europe reached about the same aggregate value as in 1927. Canadian exports in the first nine months of 1928 were 6 per

cent. larger in value than a year earlier, while the total value of exports of four important Asiatic countries declined by 3 per cent., chiefly as a result of the decrease in price of rubber and silk.

The total value of our exports of merchandise increased about 3 per cent. in 1928 and was larger than in any of the seven preceding years. As the average prices of commodities exported was unchanged, the change in value of the trade measures quite accurately the change in its physical volume. Exports of wholly and partly finished manufacturers comprised about three-fifths of the total trade (twice as large a proportion as in 1896-1900.) The size of exports of this type of merchandise is determined very largely by the extent and effectiveness of our sales efforts. The further substantial growth of our exports of these fabricated products in 1928 indicates once again our ability to compete successfully with other industrial nations.

Exports of finished manufactures have been steadily expanding for six years and in 1928 were about 70 per cent. higher in value than in 1922. The most marked growth during the past year occurred in the exports of automotive products which reached a total value of almost \$500,000,000 (according to 10 months figures) and were about one-fourth larger than in 1927, the best previous year.

During the past six years the value of our automotive exports has increased by about \$300,000,000 or more than 150 per cent. As the purchasing power and standard of living of other nations shows further improvement, it is probable that there will be yet greater demands from abroad for American automobiles. Marked gains have also occurred in recent years in our exports of many other fabricated commodities—industrial machinery, agricultural implements, office appliances, rubber tires, and cutlery.

Exports of semi-manufactures continued to show a steady growth in 1928, owing to larger sales of copper, iron and steel products, and leather in foreign countries. Exports of copper were about 7 per cent. larger in quantity during the first ten months of 1928 than in the corresponding period a year earlier. This increased demand from abroad was accompanied by a steady advance in the price with the result that the value of exports was 15 per cent. greater than in the preceding year.

The value of crude materials exported was also larger than in 1927, in spite of a smaller movement of coal, largely because the exports of cotton, tobacco, and undressed furs increased.

Exports of crude foodstuffs were materially reduced, as the movement of wheat and rye was much smaller than a year earlier. Trade in manufactured foodstuffs, on the other hand, showed comparatively

little change in value, since a marked growth in exports of canned fruits offset declines in the values of flour and meat abroad.

Consideration of the geographic distribution of the trade indicates that exports to all continents except Oceania increased in 1928. Exports to Canada increased 8 per cent. and that country advanced to first place in our trade. Much of this gain resulted from larger shipments of automobiles, agricultural machinery, and other manufactured articles.

Exports to Asia showed an even greater growth, amounting to about 12 per cent., as a consequence of largely increased shipments to China, Japan, and the Philippine Islands. Exports to China were about one-half again as large as in 1927, owing to a marked expansion of sales of illuminating oil, leaf tobacco, cigarettes, and many other manufactured products as a result of improved conditions in that country.

Shipments to South America have also continued their upward trend and reached a total value more than twice as large as in 1922. Practically all of the growth occurred in our trade with Argentina, Brazil, and Colombia, which were already our largest customers on that continent. The increased purchases of South America as in other recent years consisted largely of manufactured articles—automobiles, machinery, iron and steel products, and gasoline.

The total value of American exports to Europe was about the same in 1927 as in the previous year, the principal changes being increases in shipments to Italy, Russia, Sweden, Spain, and Poland which were about equal to the aggregate decreases in value of trade with the United Kingdom, Germany, and Denmark. The increase in exports to Italy and Russia and the decrease in exports to Germany were both ascribable largely to changes in the value of shipments of raw cotton, while the most important cause of the decline in exports to the United Kingdom was a reduction in wheat shipments. The larger part of the increase in Swedish trade and also of the decrease in Danish trade resulted from changes in the quantity of automotive products shipped to those countries and apparently represented in large part a decrease in Swedish purchases of American cars assembled in Denmark.

Demand for American manufactures continues to increase in Africa and has caused a steady expansion of our trade with that continent. Exports to Oceania which also consist largely of fabricated goods have, on the other hand, been declining as a result of smaller sales to Australia which has suffered a reduction of buying power owing to the relatively low price of some of its staple products.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

THE NATIONAL BUILDING, BRIDGEPORT, CONN. EDWARD CALDWELL, JR., ARCHITECT

T. J. PARDY CONST. CO. CONTRACTORS

"Don't let freezing weather stop your concrete work—use 'ANTI-HYDRO' and keep right on!"

"ANTI-HYDRO" lowers the freezing point of concrete to 15 degrees F. so that work can continue even though the thermometer goes way down. At the same time, "ANTI-HYDRO" permanently hardens and waterproofs concrete mixtures in one operation. Being a liquid integral compound, it mixes easily with the gauging water without the aid of skilled labor.

The concrete work on this building continued right on through freezing weather. Much valuable time was saved and results were entirely satisfactory.

For 24 years "ANTI-HYDRO" has been used on every type of concrete hardening and waterproofing work. Use it for cold weather work. It will save you time and money.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

The Forty-Second Annual Banquet of the Philadelphia Builders' Exchange and Employers' Association will be held Wednesday evening, February 13th, at seven o'clock in the Manufacturers' Club.

Members will recognize this function as the Great Annual Event of the Building Industry of Philadelphia. This year will be no exception to the effort of the committee to make this banquet the biggest and best ever. The speaker of the evening will be John E. Edgerton, President of the National Association of Manufacturers. Mr. Edgerton is thoroughly imbued with the broad aspect of business, is a forceful speaker and has studied business and industrial problems in a comprehensive way all his life.

Tickets are \$5.00 each. Reservations will be made in the order of their receipt. Standard table seats ten. You may reserve a table for as few as five.

Members are privileged to invite guests.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

Contracts Awarded

Scope of Contract and Successful Bidders; "Inside" Information for the Material Man and Interior and Exterior Fitter.

Aldine Trust Company Office Building, Southeast Corner Twentieth and Chestnut streets, Philadelphia. Architect, A. W. Hall, Fifteenth and Locust streets, Philadelphia. Owner, Richard J. Now and THEN

What a Difference Thirty Years Make

It does not seem so long ago, that contractors and builders looked forward to freezing weather with the knowledge that work in the open must be suspended. Sand and graded gravel were practically unavailable except in limited quantities.

Today — concrete construction can go merrily on throughout the most severe weather without the fear of a lack of material. This organization, with its modern facilities for production and storage, has a reserve supply of more than 350,000 tons of material, mined and cleaned in the open season. Daily deliveries are made from material stored in steam-heated bins.

EXECUTIVE OFFICES: THE PARKWAY AT 24TH STREET, PHILADELPHIA

Hosiery Mill, Bethayres, Pa. Architect, Christian H. Fries, Frankford and Oxford avenues, Philadelphia. Owner, name withheld. Brick, steel, 2 stories, 200x50 feet, slag roof, cement floors, steam heat, electric light, rolled steel sash. Contract awarded William F. Lotz, Frankford and Oxford avenues, Philadelphia.

Gardner's Cottage, Whitemarsh, Pa. Architect, private plans. Owner, Charles S. Cheston, Whitemarsh, Pa. Stone, 2 stories and basement, 31x22 feet, shingle roof, oak and pine floors. Contract awarded J. S. Cornell & Son, 1528 Cherry street, Philadelphia.

Building, Norristown, Pa. Architect, E. Lane Crawford, Norristown, Pa. Owners, Asbestos Insulating Co., Norristown, Pa. Contract awarded A. T. Allebach, Springmont, Pa.

Conservatory Group (add.), Longwood, Pa. Architect, E. William Martin, DuPont Building, Wilmington, Del. Owner, Pierre S. DuPont, care of architect. Steel, concrete, stucco, 40 feet high, 110x40 feet, 80x35 feet, greenhouse roof construction, concrete floors, hollow tile, iron stairs, steel sash, heating extension, electric light. Contract awarded William M. Francis, DuPont Building, Wilmington, Del.

Loading Station, Sharon Hill, Pa. Architect, private plans. Owner, William Freihofer, Twentieth and Indiana avenue, Philadelphia. Brick, steel, 1 story, 75x70 feet, slag roof, cement floors, steam heat, electric light. Contract awarded Henry P. Schneider, 3713 Old York road, Philadelphia.

New Jersey Construction News

Pier and Stores, Atlantic City, N. J., \$300,000. Owners, Central Pier Co., Frederick C. Robbins, secretary-treasurer, 1410 Boardwalk, Atlantic City, N. J. Fire damage. Too early for details.

Normal School, Pennington road, Trenton, N. J. Architects, Guilbert & Betelle, Chamber of Commerce Building, Newark, N. J. Owners, State Board of Education, Charles H. Elliott, secretary, State House, Trenton, N. J. Brick, steel, 2 stories. Sketches in progress.

Laundry Building, Broadway, North of Jackson street, Camden, N. J. Architect, F. N. Gaudelli, Audubon, N. J. Owners, Airlight Laundry Co., care of U. Marconi, 626 South Fourth street, Philadelphia. Brick, steel cinder block, cast stone, 1 story, 118x100 feet, metal skylights, wood and rolled steel doors. Plans in progress. Architect will take general bids in about 3 weeks.

Residence and Garage, Southeast Corner Third and Chestnut streets, Camden, N. J. Architect, F. N. Gaudelli, Audubon, N. J. Owner, name withheld. Brick, 2 stories, 30x66 feet, 1 story, 10x30 feet, slag roof, hardwood and cement floors, electric light, metal ceilings, waterproofing, concrete foundations. Plans about completed. Architect ready for general bids in one week.

Residence, Trenton, N. J., \$20,000. Architect, Walter Hankin, 224 East Hanover street, Trenton, N. J. Owners, Robinson & O'Donnell, Trenton, N. J. Brick, 2½ stories, 51x60 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Plans in progress. Owners will build.

New Jersey State Power Plant, State Office, Trenton, N. J. Associate architects, J. O. Hunt, Hunt Building, Trenton, N. J., and H. A. Kelly, 921 Bergen avenue, Jersey City, N. J. Owners, State of New Jersey, care of State House Commissioners, State House, Trenton, N. J. Stone, steel, reinforced concrete, granite, 2 stories, 55x100 feet, concrete roof and floors, roof ventilators, bond, grading, metal sash, tile, metal lath (boiler house equipment, electric, plumbing separate). Owners will receive bids February 20th.

Buildings, Northeast Corner Woodbury and Glassboro roads and Bark Bridge road, Wenonah, N. J. Architect, Irvin T. Catherine, Franklin Trust Building, Philadelphia. Owners, Wenonah Military Academy, Wenonah, N. J. Brick, steel, granite, administration building, 2 stories and basement, 240x60 feet, wing 93x50 feet; dormitory building, "B" 221x97 feet, wing 96x40 feet, 2 stories, basement; gymnasium building, "C" 2 stories and basement, 192x113 feet, bid bond, excavation, reinforced concrete work, dampproofing (Plyrite, Toch Brothers, Concrete Waterproof Paint Co., Hydroseal), cement floor, cement floor hardener (Anti-Hydro, Sonneborn, Master Builders, Builders' Specialty, Toch Brothers), waterproofing (Anti-Hydro or equal), concrete blocks, gypsum tile partitions (Structural Gypsum Corporation), cast stone (Economy, Benedict Stone, Onandaga, Formigli), iron work, bronze work, safety treads (American Abrasive Metal Co.), iron stairs, screens, hollow metal doors and trim (Dahlstrom or equal), maple and pine floors, linoleum, Rubberstone tile floors (Rubberstone Corp.), bond, metal weather strip, caulking (Arco or Pecora), composition roof (Barrett's, Carey or Johns Mansville), membrane waterproofing, variegated slate roof, skylights (Lupton's, Thorn's), skylights, ventilators (Star-Royal or Iona), metal lath, plaster bond (Plyrite or Vortex), California Stucco Interior finish (California Stucco Products Co.), tile work, marble work, plumbing, septic tank, steam heating, boiler (Babcock & Wilcox Co.),

electric refrigerator, electric work. Architect taking bids due February 8th at noon.

High School, South Clinton and Park avenue, Trenton, N. J. Architect, W. A. Kleemann, First National Bank Building, Trenton, N. J. Owners, Hamilton Township School Board, W. A. Robinson, secretary, Greenwood School, Trenton, N. J. Brick, steel, 2 stories, 282x195 feet, slag and gypsum roof, maple, concrete and linoleum floors, metal window guards, cast stone, cut stone, plaster, bronze, iron stairs, bond, septic tank, metal toilet partitions, reinforced concrete vault, tile, marble, metal lath (heating, plumbing, electric, cafeteria separate). Owners taking bids due February 11th.

Residence, Pennsgrove, N. J. Architect, C. R. Hope, DuPont Building, Wilmington, Del. Owner, Fred Gentieu, 70 West Main street, Pennsgrove, N. J. Brick, 2½ stories, 40x40 feet, shingle roof, oak and tile floors, tile work, electric light. Architect about ready for bids.

Plant, Camden, N. J. Engineers, R. A. Wickland & Co., Inc., 205 West Wacker Drive, Chicago, Ill. Owners, Rundle Manufacturing Co., care of Mr. A. C. Held, Twenty-eighth and Cleveland streets, Milwaukee, Wis. Brick, steel, concrete, slag roof, cement floors, enameling building, 1 story, 180x100 feet, cleaning building, 1 story and basement, 102x174 feet, mill and locker building, 3 stories and basement, 62x71 feet. Engineers taking bids due February 15th.

Residences (4), 1304-06-08-10 Dayton street, Camden, N. J., \$3,500 each. Architect, private plans. Owners, John Thiel, Inc., Maple Shade, N. J. Brick, block, 2 stories, 15x36 feet, slag roof, hot air heat, electric light. Permit issued.

Sewage Treatment Plant, Earlton District, Delaware Township, N. J. Engineers, Remington & Vosbury, Camden, N. J. Owners, Delaware Township Commissioners, Mrs. Wer-muth, secretary, Earlton, N. J. Brick, 1 story. Low bidder: Vincenzo Di Francesco, Llanerch, Delaware County, Pa.

Established 1914

WALTER H. THOMAS, President of the Philadelphia Chapter of the American Institute of Architects, takes a suggestion from a recent statement on "America of Today," by Andre Maurois "Remember that in all ages the great artistic civilizations have been begun by the architects. Have confidence, therefore, in the future of this one." Mr. Thomas, elaborating on the statement of Andre Maurois, presents in the January Chapter Letter a timely foreword. Mr. Thomas continues:

Without qualification, we stand on the threshold of this new year, facing the greatest opportunities for Municipal Service that have ever come to the Architectural Profession in our City.

A Philadelphia with a far broader and deeper vision is in the making. No longer will old moods and methods suffice. Vast projects under way and under contemplation demand upheavals all along the line. Architecture here must make its impress as never before.

Much has indeed already been accomplished, but isolated and self-focused betterments—regardless of their beauty or use—often hinder rather than help or else attract to themselves an undue importance and eclipse the greater vision of the comprehensive city.

We, here in America, often suffer from the urge of the Here and Now. Our impatience demands that what we conceive be completed at the earliest possible moment. We lack the patience of a Baron Haussman who—realizing that Paris, like Rome, could not be built in a day—was content in his lifetime to see established the vital parts of his comprehensive plan, wisely leaving to the future the time and cost required to unite these parts into an interwoven whole.

Let us, therefore, enthusiastically take up the Challenge of our Mayor to his fellow Citizens, and make Architecture the leader and not the follower in planning a Philadelphia of and for the Future.

In so doing, however, may we realize that although we have much to absorb from Europe, we have far more to learn from a proper interpretation of the spirit and trend of modern America. Architectural scale, for example, takes on a new meaning in our cloud-piercing skyline, which no city of Europe can, or will grasp, and the day has passed when we can stupidly transplant this or that foreign building—beautiful as it may be—and arbitrarily expect it to attune to its new world surroundings.

"New times demand new methods and new Men." May we of our Profession be in the front ranks of these new Men—realizing that each and every one of us can and must contribute his definite bit if he will only truly feel the pulse beats

of his City and help to make it like himself—an organic Reality—fully co-ordinated and functioning throughout every part of its Being.

In the Executive Committee Report published in the Chapter Letter are many interesting developments. Under the caption "Illegal Practice" the following warning is sounded:

Serious consideration was given to the situation regarding prosecution of those accused of illegal practice in this State. Inasmuch as it was found that the State Committee for Registration of Architects could not properly prosecute such cases, the Executive Committee recommended that all members of the Philadelphia Chapter be asked to voluntarily contribute to such a fund. This was likewise done in each of the other Pennsylvania Chapters. Pledges to contribute to this fund are now being received by the Treasurer.

The Philadelphia Chapter A. I. A. is represented on a Committee which is in consultation with Governor Fisher of Pennsylvania to determine an equitable plan for the selection of architects for the design of new State Buildings in accordance with the new building programme about to be undertaken by the Commonwealth.

During the year a Committee has been intensively working upon a proposed building which shall be the headquarters of the Architectural Profession and Building Industry in Philadelphia. Encouraging replies to a questionnaire indicate that before long a definite announcement may be made of the consummation of the project.

The Municipal Improvement Committee under the Chairmanship of Ralph B. Beucker devoted its energies towards furthering the project of obtaining for Philadelphia a City Planning Commission.

The Committee on Public Information under the able leadership of D. Knickerbacker Boyd, Chairman of this Committee, reported continued alertness on the part of its members. This committee has kept the newspapers and trade papers informed of architectural aims and activities. Most important has been the work of this committee in securing publicity for architects by having architects' names used in connection with buildings either illustrated or described.

THE GLAD NEW YEAR

The New Year will be glad, not sad from the standpoint of building construction. Those that live by the plough may be poor, but those that live by the hammer may rejoice with exceeding great joy. For signs are such that even the pessimists cannot interpret them dolefully.

The past year has been one of extraordinary volume in building construction, several peaks, hitherto inaccessible, were attained. The figures available when we go to press indicate an increase of 6% over last year.

Will there be a slump in 1929? No. Why should there be? With business in general booming, it is reasonable to suppose that the building business will boom also.

Of course there are developers who will tell you that things are slack for "some reason or other." And so they may be in isolated portions of the country but by and large the residential building trend is healthy and progressive.

Northern New Jersey, a productive section for developers, is exhibiting marvelous increases in building volume, as high as 50% during one month. Other sections, too, are feeling the benefits of the home-seeking public's desire to get into homes. "Small Houses Feature Late Realty Sales" runs a newspaper headline. Here is a hint of what may begin to happen in 1929. Low cost housing for the so-called "masses" offers a tremendous field for operation. A few developers are pioneering in this field but it needs more men who can provide cheap homes that are also good.

In 1929 we may expect low-priced dwellings and housing, designed and built for the ordinary wage earner, to take a new impetus which will help to accelerate the building volume of the year. Certainly no cause for pessimism exists as we commence the year with new vigor.

—Building Developer.

A most cordial invitation is extended to you by the officers, directors and members of the Association of Highway Officials of the North Atlantic States to attend our Fifth Annual Convention which is to be held at the Hotel Ambassador, Atlantic City, February 13th, 14th and 15th, 1929.

Our Program Committee under the Chairmanship of Hon. John A. McDonald, Connecticut, is bending every effort to provide a program of more than usual interest, dealing with timely highway topics and the experiences and problems which confront us in our great highway programs through the North Atlantic Section.

A. LEE GROVER,
Secretary and Treasurer,
Secretary State Highway Com. of N. J.

An increase in volume of construction is anticipated by building supply dealers during 1929 over last year, it is indicated in a survey made by the Universal Portland Cement Company, Chicago, among dealers in the company's trade territory. Nearly 1200 dealers participated in the survey.

The company makes an annual survey of dealers' opinions as to the outlook for the coming year, according to F. L. Stone, general sales manager. The dealer being in close touch with local conditions is in a good position to point the trend in the industry, Mr. Stone says, while a summary of dealers' opinions provides an index of general conditions.

Increased farm building is forecast uniformly in the agricultural states, reflecting an optimistic attitude toward the farm situation generally. This is indicated especially in the replies of dealers located in the middlewest and northwest states.

Residential construction will reach a total greater than that of 1928, the dealers believe, especially in the middlewest states. Sentiment of dealers in east central and northwest states also, points to increases in residence building in these sections.

Highway paving is expected to show an increase over 1928, while commercial building will be about equal to last year's volume, which is the case in city street and alley improvements also. While opinions indicate that the total volume in public utility construction, public building and sewer and waterworks improvements will be the same as or slightly below the level of 1928, a number of states in each classification will show slight increases or maintain the 1928 pace, according to dealers.

Taken by states, the dealers' opinions indicate prospects for a fair increase in total construction in the middlewest states of Illinois, Indiana, Michigan, Wisconsin, and Iowa, smaller increases in Pennsylvania, western New York and Ohio, while in the northwest, Minnesota dealers expect an increase and the Dakota Dealers anticipate a total volume about equal to 1928.

DOMESTIC AND FOREIGN TRADE OUTLOOK

By DR. JULIUS KLEIN, *Director, Bureau of Foreign and Domestic Commerce, Department of Commerce*

(Continued from last week)

Imports of the United States were valued at about \$4,100,000,000 in 1928, or 2 per cent. less than in the preceding year. There was a further moderate decrease in import prices during the year, so that the quantity of goods imported was actually larger than in 1927. The average price of rubber was about one-fourth lower than a year earlier, and there were also marked declines in the average unit value of raw silk, sugar, and many other commodities which we import in large quantities.

Of the five great economic classes of imports only crude foodstuffs and finished manufactures showed increases in 1928. The rise in value of crude foodstuffs was primarily a result of an increase in both the quantity and average price of our imports of coffee, while about one-half of the advance in imports of finished manufactures was due to increased purchases of burlaps.

Crude materials, the most important class of imports, decreased in value about 9 per cent., as a result of lower prices of rubber and silk and smaller purchases of rubber, tobacco, and furs. Imports of hides and skins on the other hand, increased in value by more than one-third, as there were larger purchases at much higher average prices.

Decreases in both the quantity and value of sugar imports accounted for the decline of more than one-tenth in imports of manufactured foodstuffs. There was very little change in the value of semi-manufactures imported, as large increases in imports of fertilizers and leather about

balanced declines in the value of tin, lumber, and aluminum purchased in foreign countries.

The only important changes in the geographic distribution of the import trade in 1928 were a decrease in imports from Asia, ascribable chiefly to the lower average prices of rubber, silk, and tin, and an increase in imports from South America which resulted from larger purchases of coffee, nitrates, and petroleum.

In summarizing conditions at the end of 1928, we may state that domestic production and trade are in record volume and that our foreign commerce continues to show steady growth as a result of an increasing foreign demand for American manufactures. The maintenance of our imports at about the same level as in the two preceding years indicates the large purchasing power and general prosperity of the United States.

"CONFERENCE APPROVES SIMPLIFIED PROGRAM FOR METAL TOILET AND SHOWER PARTITIONS"

A general conference of manufacturers, architects and other users of metal toilet and shower partitions, held January 16th, 1929, at the Department of Commerce, gave informal approval to a proposed simplified practice recommendation for metal toilet and shower partitions.

It was the opinion of the conference that the proposed simplification represented the best thought and practice in the industry, and, after acceptance by the industry, should prove beneficial to architects, contractors and engineers, as well as to the manufacturers themselves. The co-operative services of the Division of Simplified Practice of the Bureau of Standards, Department of Commerce, were requested, by the Metal Compart-

ment Manufacturers' Association, for the presentation to the interested elements of the industry, of the proposed program.

The conference voted that the recommendation, subject to written acceptance by the industry, should become effective on July 1, 1929. The conference also voted to have a standing committee appointed, to consist of three representatives from the manufacturers and three from the user groups.

Science and the glass maker have made it possible for the person who has been advised to "get out in the sunshine" to bring the sunshine and its beneficial rays indoors, Dr. Donald C. Stockbarger of the Department of Physics of Massachusetts Institute of Technology, told members of the National Housing Association Conference in Philadelphia recently.

Speaking at the session devoted to housing and health, Dr. Stockbarger suggested the possibilities of utilizing the inexhaustible supply of health-giving ultra-violet in the sunlight for the benefit of the home.

The beneficial rays of the sun, he explained, cannot pass through ordinary window glass. Within recent years, however, science has developed certain kinds of glass which permit the health-giving rays of the ultra-violet family to enter our homes to give us much of the benefit of unobstructed sunlight. "Thus we have the assurance," he said, "that the ultra-violet home is at hand and that our expectation of health, particularly during the winter months when we are indoors so much, is greatly increased.

"Now that it is possible to bring natural sunlight into the home by fitting our windows with glass which transmit the valuable ultra-violet, more thought should be given to the matter of utilizing it to the greatest advantage. The home of today, equipped for the benefits of sunlight, should be planned so that those rooms in which our families spend most of their time will have as much sunshine as possible."

The ideal ultra-violet home, Dr. Stockbarger said, might be one in which the conventional order of location of rooms was reversed. Sleeping chambers would be placed on the ground floor, while the living room, study, nursery or playroom would occupy the second floor. By the use of wide skylights and windows fitted with ultra-violet transmitting glass, the rooms in which the average family spends most of its time would thus get the greatest benefit from sunlight.

Speaking of the possibilities of utilizing natural sunlight in the interior of homes, Dr. Stockbarger said: "We all agree that we need sunlight, and most of us are too busy to spend much time out in the open. We cannot very well remove

the glass from our windows in order to let all of the solar ultra-violet in, and therefore we must adopt some new material to replace the old glass. We must have something which is permanent, pleasing in appearance and not too expensive. At present, quartz, which we all know is the most transparent of all available materials, costs too much for general use. Possibly some day it will be within the reach of some of us if some method can be found to produce it on a sufficiently large scale. Fortunately, however, we do not have to wait for that time, for already a number of special glasses have been developed. Several of these transmit some of every color of ultra-violet present in natural sunlight. It follows, and indeed has been proved by numerous experiments, that the same kind of benefits are to be derived from basking in the sunshine behind a good ultra-violet-transmitting window as from doing the same thing out in the open.

"But how long will such a window retain its ultra-violet transmitting properties? We ask this question quite naturally because someone discovered that after several months of use the glasses were not as transparent to some of the ultra-violet colors as they were originally, i. e., they became solarized. Of course the decrease in transparency was not serious, but somebody else made a suggestion that might lead one to believe that if these glasses depreciate slightly in a month the material would in time be no better than ordinary window glass.

"Whoever invented the solarization bugaboo evidently did not know that such processes slow down very rapidly so that after a short time they come to a standstill. I have specimens of ultra-violet-transmitting glass which have been solarized to the limit. I know that the limit has been reached because they were tested from time to time during the solarization process and those tests proved conclusively that depreciation stopped soon after it began.

"Is it necessary to sit directly in front of the window in order to receive solar ultraviolet? The answer is "No." The ultra-violet part of sunshine behaves much the same way as does the visible part, i. e., it is readily diffused and reflected.

"Of course we must admit that diffused ultraviolet such as that to be found in remote corners of a room and that which enters a north window is very much less intense than that in direct, full sunshine. Very naturally this raises the question as to how much ultraviolet we must have. In other words does it pay to use ultra-violet-transmitting glass in north windows or in any window which is not in line with the sun and the persons who are hoping to receive some benefit from the radiation? So far we have very little in-

formation on the amount required, but the question of dosage will be worked out before long. One thing immediately suggests itself as being evident, however, and that is that the amount of ultra-violet required to maintain good health should be much less than that needed to cure. It is the classical idea that an ounce of prevention is worth a pound of cure. I shall be surprised if it is ever definitely proved that the ultraviolet in the north light is of no value."

In planning a home to get the greatest benefit of natural sunlight, Dr. Stockbarger suggested the possibility of making windows wider and higher, and placing them in unconventional locations. "I would suggest," he said, "that skylights be used wherever possible, for a few of these could let in more health rays than all of the rest of the windows combined. I believe also that it may be found that the intensity of diffused ultraviolet in a room is dependent on the kind of floor and wall coverings and on the finish employed on tables and other objects in the room."

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public associations tending to overcome the natural habit of procrastination.—Making advertising pay.

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

"ANTI-HYDRO" Prevented a Bad Freeze on this Job

"ANTI-HYDRO" was used to harden the concrete floor in this building and to prevent it from freezing during construction. "ANTI-HYDRO" also makes the concrete resistant to brine and blood.

When this concrete floor, laid on cork insulation, was about three-fourths completed, during the month of February, the temperature suddenly dropped to 18 degrees and a heavy snow storm caused a two-day lay-off.

The floor was not covered and the materials were not heated, but the concrete did not freeze, and the floor did not have to be torn up and relaid. Furthermore, it protected the costly insulation. This saving alone made "ANTI-HYDRO" extremely valuable on this job.

"ANTI-HYDRO" is a liquid integral compound which when added to the water used for mixing concrete makes the concrete permanently hard, absolutely waterproof and resistant to the action of acids, alkalis and oil. It is easy and economical to use and requires no skilled labor for the mixing process.

For 24 years "ANTI-HYDRO" has been in continuous use on every type of concrete work. Satisfactory results are guaranteed. Use it in your next job.

Plants From Coast to Coast

CALIFORNIA STUCCO (Exterior)

is a Nationally distributed and Nationally accepted Stucco, backed by a lifetime of experience and study and on the Market since 1914.

California Stucco has been used for years under every conceivable weather condition. It has withstood the extreme temperature changes of the high mountains, the salt air and rains of the beaches and the constant sunlight of the deserts, all because it is made of White Portland Cement and white pure silica sand base, natural mineral color pigments ground together at the mill under expert supervision.

California Stucco has been used successfully for years in such widely diversified climates as Boston, Kansas City, Seattle, and Los Angeles, so that we may truly say climate is not a factor where California Stucco is used.

Colors are almost unlimited and may be selected from the showrooms of the various plants from coast to coast with the assurance of a uniformity of both color and quality.

Textures are limited only to the imagination and skill of the craftsman applying the stucco.

Individuality—California Stucco offers one the opportunity to express individuality outside or inside the home.

Office Bldg. (add.), Wilmington, Del., \$1,200,000. Architect Bernard Converse, DuPont Bldg., Wilmington, Del. Owners, Delaware Trust Co., Ninth and Market streets, Wilmington, Del. Brick, limestone, steel, 13 stories and basement, 2 wings, 135x52 feet each, steam heat, electric light, tile and marble work, metal lath, slag roof, cement floors, elevators. Contract awarded Wark & Co., 1600 Walnut street, Philadelphia.

BUILDING VOLUME IN PENNSYLVANIA CITIES AND BOROUGHS FOR 1928 IS ONLY 4.1 PER CENT. BELOW 1927

According to reports of building permits submitted to the Department of Labor and Industry from 39 Pennsylvania cities and boroughs, the estimated cost of building construction, including additions and repairs, was \$12,296,192 for December, 1928. This amount compared to the \$12,197,253 building total reported by the same cities and boroughs for December, 1927, represents an increase for December, 1928, of \$98,839 or 0.8 per cent. Weather conditions more favorable for building construction prevailed throughout the month of December, 1928, than in December, 1927, as is indicated by the small decline of 2.7 per cent. in building construction employment for December, 1928, as compared with November, 1928, while for December, 1927, there was a 14.9 per cent. decline as compared with November, 1927.

Of the 39 cities and boroughs reporting for December, 22 reported increases over December, 1927, sixteen reported decreases, and one, Donora, reported no permits issued in December of either year. Of the 22 cities reporting increases for December, 1928, nine report increases in excess of \$100,000 each, as follows: Altoona \$677,908, or 940.9 per cent.; McKeesport \$227,690, or 354.8 per cent.; Wilkes Barre, \$206,855, or 221.0 per cent.; York, \$186,640, or 601.7 per cent.; Allentown \$152,275, or 57.7 per cent.; Johnstown \$151,135, or 940.8 per cent.; Meadville \$144,175, or 928.7 per cent.; Washington \$142,235, or 4258.5 per cent., and Jeannette \$103,000, or 3218.8 per cent. The other 13 cities that reported increases for December, 1928, over December, 1927, are listed below with the amount and per cent. of increase.

City	Amount of Increase	
	Per cent.	
Bradford	\$ 8,500	47.1
Carlisle	22,070	185.0
Erie	14,570	6.1
Hazleton	15,468	86.7
Lancaster	79,803	18.3

New Castle	10,735	18.8
Pottsville	20,250	43.6
Scranton	49,650	26.9
Tyrone	1,000	200.0
Wilkesburg	38,876	274.7
Williamsport	93,250	214.3

Of the 16 cities that report decreases in building construction volume for December, 1928, from December, 1927, five report declines in excess of \$100,000 each, the city of Pittsburgh, leading with a decline of \$830,326, or 26.0 per cent; Philadelphia, second with a decline of \$492,610, or 8.1 per cent; Oil City, third, with \$453,107, or 96.0 per cent.; Reading, fourth with \$183,327, or 65.4 per cent.; and Easton, fifth, with \$133,320, or 73.9 per cent. The city of Harrisburg shows a decrease of \$78,425, or 60.8 per cent., and the remaining 10 cities show decreases of less than \$25,000 each as follows:

City	Amount of Decrease	Per Cent. Decrease
Berwick	\$ 1,750	32.9
Bethlehem	16,354	17.0
Bristol	21,100	95.5
Butler	9,160	60.6
Clairton	592	7.1
Duquesne	2,055	15.6
McKees Rocks	150	100.0
Sunbury	1,800	26.5
Uniontown	12,065	42.2
Warren	15,425	100.0

Comparable building construction data is available for the years 1928 and 1927 for 30 cities and 9 boroughs of Pennsylvania. The total estimated cost of construction work reported by these 30 cities and 9 boroughs was \$213,717,416 for the year 1928, compared to the total of \$222,843,983 for the year 1927, a decrease in 1928 of \$9,126,567, or 4.1 per cent.

Thirteen cities and boroughs report increases in the volume of construction for 1928 over the totals reported for 1927. Three of the 13 cities that exceed their 1927 totals by more than a million dollars each are as follows: Pittsburgh, \$2,270,200, or 6.1 per cent.; Harrisburg, \$2,057,535, or 57.6 per cent., and Bethlehem, \$1,400,157, or 56.4 per cent. Three others top their 1927 totals with increases between a quarter million and a half million dollars. These are Bradford, \$468,274, or 83.5 per cent.; Meadville, \$411,904, or 59.6 per cent., and York, \$287,398, or 18.1 per cent. The other seven cities that show increases for the year 1928 and the amount and per cent. of increase for each are listed below:

City	Amount of Increase	Per Cent. Increase
Altoona	\$183,857	6.0
Clairton	171,177	41.7
Donora	18,050	12.2

McKeesport	132,520	5.9
McKees Rocks	69,073	16.0
Monessen	110,130	28.4
Tyrone	24,300	8.7

The amounts of estimated cost of building construction reported by each of 26 cities and boroughs for 1928 are less than the amounts reported for 1927. Only 3 cities report decreases of more than a million dollars each — Philadelphia, \$5,356,565, or 4.6 per cent.; New Castle, \$1,568,470, or 51.6 per cent., and Scranton, \$1,300,249, or 22.1 per cent. Nine other cities report decreased amounts between a half million dollars and a million dollars as follows:

City	Amount of Decrease	Per Cent. Decrease
Allentown	\$653,129	9.9
Easton	567,422	43.7
Erie	629,368	11.7
Hazleton	576,776	33.3
Pottsville	580,765	28.8
Reading	834,538	17.9
Uniontown	909,256	57.7
Wilkes-Barre	942,472	19.2
Williamsport	634,520	23.1

The remaining 14 cities that report decreases in building construction for 1928, with their amounts and per cent. of decrease follow:

City	Amount of Decrease	Per Cent. Decrease
Berwick	\$ 80,775	52.6
Bristol	109,633	34.1
Butler	259,349	38.9
Carlisle	316,745	37.5
Duquesne	65,187	7.8
Jeannette	387,115	60.5
Johnstown	292,384	21.1
Lancaster	244,858	8.1
Monongahela	38,860	26.8
Oil City	128,640	9.1
Sunbury	136,284	35.7
Warren	111,620	19.7
Washington	2,973	0.6
Wilkesburg	3,189	0.2

Classification of the reports submitted to the Department for December, 1928, as to types of buildings shows a slight decline in December, 1928, in the number of new residential buildings to be erected. However, the average estimated cost of construction of new residential buildings for December, 1928, is \$765 more than for December last year, an increase of 11.7 per cent. New non-residential buildings likewise show a decline in the number to be erected in December, 1928, but with average estimated costs exceeding those for December, 1927, by more than \$1,132, or 8.4 per cent. The amounts to be expended for the construction of churches, factories, bakeries, laundries, etc., and for stores and other mercantile buildings in December, 1928, are far in excess of the 1927 amounts, while the amounts to be expended for amusement and recreation places, public and private institutions, and schools are considerably less for December, 1928, than for December, 1927. Less costly additions, alterations and repairs to buildings were made during December, 1928, than in December, 1927, as is shown by the average cost per building. The average cost of remodeling work as shown by the December, 1928, permits was \$1,677, as compared with an average of \$1,820 for December, 1927, a decrease in 1928 of \$143, or 7.9 per cent.

It was thought early in 1928 that the total of building construction work in Pennsylvania cities and boroughs for 1928 would fall considerably below the totals for the two years immediately preceding. However, the building record for 36 Pennsylvania cities and boroughs shows that the combined volume of building in these 36 places during 1928 was only 4.1 per cent. less than in 1927, and only 3.7 per cent. less than in 1926. With contract awards holdings up so well during the late months in 1928 there is reason to believe that building in 1929 will

\$27,500 IN PRIZES OFFERED FOR SMALL HOUSE DESIGNS

Educational Program of Home Owners' Institute to Include the Largest Architectural Competition Ever Held in the Residential Field

Within a few weeks there will be officially announced the most extensive architectural competition for small house design ever undertaken in the history of the building industry. Not only is the amount of prize money, \$27,500, at least three times that of any other competition, but there are two special features of interest which are unique. The first is that this competition will be held in twelve regional districts of the United States and the national entries will be the winning designs of these districts. The second is that the winning designs in each of the regional districts will actually be constructed.

Raymond Hood, of New York and Chicago, internationally known as one of the leading architects of this country and a prominent member of the American Institute of Architects, has agreed to act as Chairman of the National Committee of Arrangements for this competition, and also as Chairman of the Jury of Award of the National Competition. Mr. Hood, aside from conducting a recent small house competition sponsored by the *Chicago Tribune*, has often been a member of competition juries and is unusually familiar with this type of educational activity, from which important contributions may be expected for the benefit of the home-building public. Mr. Hood is thoroughly familiar with the competitor's phase of architectural competitions, being himself (in association with John Mead Howells, of Chicago) the winner of the \$100,000.00 grand prize awarded by the *Chicago Tribune* in its International Architectural Competition for its own Tower Building in Chicago. Among Mr. Hood's other noteworthy architectural achievements may be included the American Radiator Company buildings in New York and London, and a large number of designs of buildings of all types. The primary reason for Mr. Hood's interest in this competition and his willingness to work with the Home Owners' Institute in its development is the hope that it may bring out a number of practical ideas for improvement in the design and the average cost of the American home, particularly in respect to efficiency of plan, with proper regard for the economies of good quality in construction and equipment to develop higher investment values.

CONSULTANT FOR COMPETITION PROGRAM

C. Stanley Taylor has been retained as consultant in the development of the competition program and the operation of the national and local competition involved. Mr. Taylor is President of the firm of Taylor, Rogers & Bliss, Inc., which is the leading consulting organization of the building field, and is a member of the firm of Lyon & Taylor, Architects and Building Consultants of New York, and Vice-President and Director of Research of National Building Publications, publishers of the *Architectural Forum*, *Building Age*, and many other publications which are closely affiliated with the building field.

Under the direction of these two men of outstanding reputation in the architectural profession and building industry it is anticipated that the program for the National Better Homes Architectural Competition will represent the most comprehensive and practical project of this kind ever undertaken.

In order to render this competition attractive even to leading architectural firms in the residential field, prizes amounting to \$27,500 will be awarded as follows:

A First Grand Prize of...	\$5,000.00
A Second Grand Prize of	3,000.00
A Third Grand Prize of	1,500.00
36 Regional Prizes of	
\$500 each	18,000.00

Total Prize Awards...\$27,500.00

It is quite probable that in addition to these prize awards several of the co-operating newspapers will offer special awards.

The general procedure in this proposed competition is as follows:

A geographical sub-division of the United States will be made, splitting the country into twelve areas, in accordance with the accompanying map. The first step of the competition will be that architects, draftsmen or architectural students will compete in a local competition, each within the area in which his home or home office is located. In each of these areas one popular newspaper will act in co-operation with the Home Owners' Institute, publishing the details of the competition and the prize winners. There will be a local Jury of Awards appointed in each area and consisting probably of three or more architects, a contractor and a real estate expert recommended by the National Real Estate Board. The local jury in each of the twelve areas will select the three prize-winning designs submitted. Each of these designs will be awarded a prize of \$500 in the local competition and the three designs will immediately be submitted to the National Jury.

This will provide 36 entries in the National Competition, from which the first, second and third prizes of \$5,000, \$3,000 and \$1,500, respectively, will be awarded.

UNLIKE OTHER COMPETITIONS

Unlike other competitions, the program will provide that competitors must design houses using nationally-advertised, trade-marked, high-grade materials which have national distribution. A definite outline specification will be provided with the competition program in order to produce a well-balanced practical home, and there will be certain plan restrictions which will insure practicability of the house for the average sized lot.

Two types of dwellings will be called for in this competition. In fact, it will be divided into two classes, and all competitors may submit as many designs as they wish. All designs must come under the following two descriptive classifications:

Class A—6 principal rooms, including at least 3 bedrooms, 1 bathroom and lavatory.

Class B—7 principal rooms, including at least 4 bedrooms, 2 baths and lavatory.

Each of the above types of houses will be given a cubic foot limitation, so that all houses will fall within two approximate cost limitations.

CONTRIBUTE TOWARD BETTER HOMES

While many small house competitions have been conducted in the past, it is obvious that with the tremendous volume of home building which is now going on, lessons are constantly being learned and planning is being made more practical and more efficient. There is a general trend in the United States today toward the use of materials and equipment of better quality and toward the elimination of high maintenance and replacement costs through the medium of good construction. There is a trend toward economy through more efficient planning and the architect's contribution to comfort and convenience without greatly increased cost has become generally recognized.

The moderate cost home building field is found in the following two popular ranges of cost: first, from \$7,000 to \$15,000, and from \$15,000 to \$25,000. It is this field that particularly needs the development and dissemination of practical information regarding home planning, construction and equipment. It is this field that needs to learn more completely and conclusively the lesson that cheapness does not represent sound economy.

The Home Owners' Institute, having developed and supervised the construction of model homes in more than sixty communities throughout the United States during the past three years, has decided that a National Architectural Com-

petition, such as that described herein, will result not only in the production of many interesting and practical dwelling plans, but in the development of planning and construction ideas of great value in their application to new homes everywhere. This question has been discussed with many prominent architects, with the National Association of Real Estate Boards, with editors of architectural and building publications, and with many others, all of whom have strongly approved this proposed program.

COMPETITIONS HERETOFORE LIMITED

During past years there have been a number of architectural competitions for small house designs, but as a rule each has been limited to one class of material or product, and accordingly has placed certain restrictions on the flexibility of the designer's thought. In the present competition the designer can use exteriors of any type and he will be given a broad enough outline specification so that no degree of flexibility is lost. Many plans which have resulted from previous competitions have shown an exceptionally high degree of artistic merit and many have been thoroughly practical in plan, but it is also true that perhaps the majority of plans submitted were impractical because of the high construction cost, wasteful floor planning, and "freak" design, which would result in a bad real estate investment. Also, many of those planned, while extremely attractive, have been so spread out in design that they could not be accommodated on the average lot held by the prospective builder of a moderate cost dwelling.

INFLUENCE OF LARGE PRIZE AWARDS

In reviewing the programs of various small house competitions which have been held in the past, it became apparent that probably the highest single award ever offered for the winning design has been \$1,500. The winner of the National Better Homes Competition will receive a prize of \$5,500. The total prize money involved in smaller competitions has probably never exceeded \$6,000 or \$7,000. The total of prizes offered in the Na-

tional Better Homes Competition is at least \$27,500. The total number of actual prize awards in any one previous small house competition has probably not exceeded fourteen. The total number of actual prize awards in the Better Homes Competition is thirty-nine.

Mr. Hood and Mr. Taylor both express themselves as believing that this prize of such a substantial nature should call forth the efforts of a large number of the more prominent architectural offices, particularly those skilled in domestic architecture, and for this reason the quality of the resulting plans should be of the highest degree ever attained in any National Competition of this nature and consequently of the greatest public value.

JUDGING THE DESIGNS

In each region the Competition will be conducted with the co-operation of a leading newspaper; newspapers generally that have been co-operating with Home Owners' Institute in its National Demonstration Model Homes Campaign. The entries will be submitted direct to the newspaper in each region. The regional designs as submitted will be judged by the specially appointed regional Juries of Award, which will in reality be regional architectural committees.

All regional Prize Winning Designs will be then assembled and judged for the Grand Prizes by the Jury of Award under the Chairmanship of Mr. Raymond Hood, A. I. A. There may be additional regional prizes offered. Several newspapers have already signified their desire to offer additional prize awards regionally. The Juries of Award, both regional and national, will be organized to consist of a majority of architects, together with at least one real estate expert and one experienced building contractor to check on the occupancy and constructional values of the design. It is desired above all things that the house plans produced through this competition will be not only of a high degree of architectural merit, but will be practical from the points of view of real estate values, constructional

integrity and sound construction economies.

BUILDING THE PRIZE DESIGNS

The last and perhaps the most interesting and important feature to result from the National Better Homes Architectural Competition will be the ultimate construction of prize-winning designs throughout the country. Each prize design (possibly some of the honorary mention designs) will be constructed, directly following the conclusion of the Competition, in the regions where the plans are originated.

Of greatest value will be the actual construction cost figures made available as a result of their actual construction, simultaneously, throughout the United States. In this the National Association of Real Estate Boards has agreed to aid. The findings will be of considerable value to that and to other organizations, as well as to the architects and builders, and the general home-seeking public.

ARCHITECTURAL SUPERVISION

As heretofore in the construction of demonstration model homes in connection with campaigns conducted under the auspices of Home Owners' Institute, the prize design model homes will be built with local architectural supervision, so that, without question, each designer's plans, the specifications and the actual work of construction will be properly interpreted in the finished model homes.

Coincident with the building of the prize designs, the co-operating newspapers, additional newspapers, and many magazines in the architectural and home-building fields, will aid in the educational program by publishing illustrated articles on the progress of construction and the cost findings. This support has already been definitely pledged by many.

PROGRAMS

Programs for this competition may be obtained when they are ready by addressing Home Owners' Institute, 441 Lexington Avenue, New York City.

I make it a rule never to write a grouchy letter—I telephone.

VENTILATE PUBLIC GARAGES

The extent to which thousands of automobile owners are exposed to the poisonous fumes of carbon monoxide in many public garages which have inadequate equipment for positive mechanical ventilation of their driving and storage space, should be a matter for special investigation by health authorities.

This is especially true during the cold season of the year when garages are packed to capacity with cars which entail the almost constant running of many engines with a steady outpour of the deadly burned gas. In some cities, ordinances require changing the air completely a specified number of times every hour and to meet these requirements the large garages have installed exhaust fans and other equipment for controlling air conditions. The trouble is, however, that even in these places, it has been found that the equipment is not operated sufficiently, if at all.

Every year, there are hundreds of accidental deaths caused by carbon monoxide. That is the spectacular feature of it. But there are no statistics available which reveal the thousands of persons who are annually poisoned by carbon monoxide without fatal results. Their bodies are weakened for easy attack by disease and their health jeopardized by this vicious poison. It is an unseen enemy which strikes insidiously and without warning. Physicians have found that even a small amount of carbon monoxide has a very deleterious effect on the blood and brings about organic disorders.

The smaller type of garage can be made safe by the use of exhaust fans, ventilating experts have found, but larger garages, where numerous cars are operated, should provide a properly designed exhaust system of ducts connected to suitable exhaust fans. Tests have shown that climatic conditions vary so much that vitiated air will not exhaust by natural means through vents located on the roofs. The air and gases must be driven out by fan action.

Several of the largest automobile manufacturers are to be congratulated on their efforts to protect the public health by insisting that their branch distributors and dealers provide controlled mechanical ventilation in their garages and service stations. One leader in the industry sent out a message to its dealers which should be seriously read and acted upon by every garage operator and service manager. This bulletin should be posted up on the door of every garage:

"The repair room, where the mechanics are making adjustment of carburetors or testing engines, should by all means be amply ventilated at all times. In fact, special attention should be given to this room, to provide sufficient ventilation in order to protect the workmen properly.

It is a good plan to have flexible metal hose connections, with a series of adapters, so that the exhausts of the cars being tested may be connected to duct outlets where there is sufficient mechanical draft to expel the gases.

"During the rush periods, when the greatest number of cars are either going out or coming in, the generation and accumulation of gases become the greatest. Therefore, during these periods the ventilating equipment should be operating continuously at maximum capacity, in order to exhaust the vitiated air as quickly as possible."

Physicians of the public health service have urged that the air in all garages should be completely changed at least five times every hour. This, it is pointed out, would be sufficient to dilute the deadly gases as to remove serious danger of poisoning.

PREVENT FIRE

By W. E. MALLALIEU

General Manager of the National Board of Fire Underwriters

Do we build to burn? Naturally, we answer that we do not build to burn—purposely. The fact remains, however, that inferior construction, knowingly erected, is given as one of the chief causes of the flaming annual sacrifice to the gluttonous god of fire.

Construction which does not render a building permanently rigid and reasonably safe from destruction by fire and other elements proves costly in the long run. The purchaser of a cheap house is often disappointed in what he buys, and developers are discovering that it does not pay to offer poorly constructed homes for sale because home seekers are now aware that this kind of dwelling makes a bad financial investment. It is poor judgment to build or buy a house in which cheap materials and methods have been used.

How can a building be constructed to resist fire? First, the plans must be designed by someone who will give thought to that phase of the building problem. In the past, many developers have been chiefly concerned with the three factors of appearance, arrangement and cost, giving little consideration to the element of safety. Now, however, some designers are making a study of fire prevention engineering, and architects and engineers generally are more interested than formerly in preventing fires.

Next must be considered the materials which go into the fire-resistive building. It is essential, if the structure is to last, and not burn, that they shall be the best that cost and other conditions warrant. Many building materials have been tested

by severe fire conditions under expert control and observation, for the purpose of determining their quality, and it is now possible to know whether they are worth using before actually employing them. Even in dwellings some materials should be incombustible, although many of them, of course, cannot be.

Among the worst defects in the majority of dwelling houses are the open passageways in frame walls and partitions. If fire starts in the cellar or basement, these openings act as flues to carry smoke and flames to the attic; if it occurs in the upper part of the house, on the other hand, sparks may fall into the hollow spaces. In either case the fire has had an opportunity to spread. Many dwellings which have burned to the ground could have been saved with only partial damage had attention been given to fire-stopping when they were built. By fire-stopping is meant cutting off each floor from that above and below, so that fire cannot spread without actually burning through the floor. The material used should be incombustible and laid only by experienced and scrupulous workmen. Simply nailing in pieces of left-over wood will not afford sufficient protection.

In view of the staggering annual fire loss in the United States, it is interesting to note what is being done to improve construction. Better conditions are gradually being brought about by the competent enforcement of sound building laws. Many of them follow closely the recommended Building Code of the National Board of Fire Underwriters, which details specifications for safe construction; buildings designed in accordance with this code will be as well built and protected as the quality of the materials used will permit.

For owners of dwellings and for carpenters and builders, the National Board has issued a code of suggestions in regard to construction and fire protection, which is recommended to safeguard homes and lives against the ravages of fire.

A Standard Ordinance for Building Construction, recommended by the National Board and recently published as a third edition, provides specifications for safe chimney construction. This ordinance has been reviewed and formally approved by various national organizations interested in the building industry and well qualified to judge of its merits. —*Building Developer.*

The time to save the building is when the plans are on the drafting board is the new cry for fire prevention.

Many a man would do a better job if he didn't know about putty.—*Ex.*

Insurance
Company"**

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

"ANTI-HYDRO" Prevented a Bad Freeze on this Job

"ANTI-HYDRO" was used to harden the concrete floor in this building and to prevent it from freezing during construction. "ANTI-HYDRO" also makes the concrete resistant to brine and blood.

When this concrete floor, laid on cork insulation, was about three-fourths completed, during the month of February, the temperature suddenly dropped to 18 degrees and a heavy snow storm caused a two-day lay-off.

The floor was not covered and the materials were not heated, but the concrete did not freeze, and the floor did not have to be torn up and relaid. Furthermore, it protected the costly insulation. This saving alone made "ANTI-HYDRO" extremely valuable on this job.

"ANTI-HYDRO" is a liquid integral compound which when added to the water used for mixing concrete makes the concrete permanently hard, absolutely waterproof and resistant to the action of acids, alkalis and oil. It is easy and economical to use and requires no skilled labor for the mixing process.

For 24 years "ANTI-HYDRO" has been in continuous use on every type of concrete work. Satisfactory results are guaranteed. Use it in your next job.

LIGHT AND AIR AT LOW COST

Lupton Pivoted Windows provide the proper amount of light and air for industrial buildings. They are rigidly built of steel, operate easily and give high investment value. They cost no more and frequently less than equal areas of masonry wall. Use them liberally. Small orders promptly filled from warehouse stocks. Thirty-nine sizes meet all ordinary requirements.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

Contract awarded Union Building Co., Newark, N. J.

Storage Building, 80 Hamilton avenue, Trenton, N. J., \$20,000. Architect, private plans. Owners, American Steel & Wire Co., Hamilton avenue, Trenton, N. J. Concrete, steel, 1 story, 60x230 feet, steel roof, steel sash. Contract awarded American Bridge Co., Warren street, Trenton, N. J.

Store (alts.), 147 South Broad street, Trenton, N. J., \$2,000. Architect, private plans. Owner, Emile L. Meyer, on premises. New front, 16x75 feet, slag roof, general alterations. Contract awarded LeRoy Loabe, Sanhian Drive, Trenton, N. J.

Residence, 1251 South Merrimac road, Camden, N. J., \$3,000. Architect, private plans. Owner, Vincenzo Imbesi, 1271 South Merrimac road, Camden, N. J. Brick and block, 2 stories, 16x37 feet, slag roof, hot air heat. Contract awarded Carmelo Olivieri, 100 East Holly avenue, Oaklyn, N. J.

Miscellaneous Construction News

Paper Mill, Matawask, Me. Architect, W. E. S. Dyer, Land Title Building, Philadelphia. Owners, Fraser Company, Matawask, Me. General reconstruction. Plans in progress.

Residence (alts. and add.), 2310 West Seventeenth street, Wilmington, Del. Architect, E. C. May, DuPont Building, Wilmington, Del. Owner, E. G. Ackart, on premises. Brick, second story add., 20x14 feet, built-up roof, hardwood floors, heating extension, electric work, tile work. Plans in progress.

Residence (add. and alts.), 2003 Parkway, Wilmington, Del. Architect, E. C. May, DuPont Building, Wilmington, Del. Owner, G. R. Kaiser, on premises. Brick or tile and stucco, 1 story, built-up roof, electric light, tile work, flagstone. Plans in progress.

Hotel, Dover, Del. Architects, Brown & Whiteside, DuPont Building, Wilmington, Del. Owners, care of L. Allee, attorney, The Green, Dover, Del. Brick, steel, frame, 3 sto-

ries and basement, 128x40 feet, slate and slag roof, tile and oak floors (heating, plumbing and electric separate), tile and marble, iron stairs. Architects taking bids due February 23rd.

Miscellaneous Contracts Awarded

Residence, Wawasett Park, Wilmington, Del. Architects, Brown & Whiteside, DuPont Building, Wilmington, Del. Owner, J. F. Otwell, care of architects. Tile, stucco, frame, 2½ stories, 32x50 feet, slate roof, hardwood floors, oil burner, electric light, tile work. Contract awarded A. L. Lauritsen, DuPont Building, Wilmington, Del.

A NEW TOOL FOR GREATER PROSPERITY

An Address by CHARLES F. ABBOTT,
*Executive Director, American
Institute of Steel Construc-
tion, Inc.*

Co-operation is hastening and intensifying the newer competition in industry concerning which we have heard much since 1925, the year when the Supreme Court of the United States announced its notable opinions on trade associations and trade association work. It is this newer competition, the competition between industries, which is today making us conscious of the newer forces at work to make business prosperous.

It is essential that we shall define clearly these newer forces if we are to make profitable use of them. We must recognize them for what they are and learn how to use them for the betterment of business. And I venture to say that no greater force presents itself than *obsolescence*.

By obsolescence I mean the scrapping of obsolete goods and machinery; teaching people how to know when something is obsolete, passe, outmoded or a back number, in style, color, form or efficiency; how to courageously change to the new,

and to get millions more people to do so, and to see that they get the income with which to do it.

Advertising men have always understood this principle better than most people. They have labored long and hard to make the manufacturers understand and realize that they were too frequently holding fast to obsolete ideas of selling and advertising.

The steps leading to the greater use of these tools have been gradual and logical. With industries competing against each other we saw profits declining. Then we realized the need of creative and co-operative selling, and that if we wanted more business at a profit we would have to *speed up demand; intensify consumption*. We experimented with instalment selling, and today it serves a purpose. It has definite limitations. It makes it dangerously easy to pyramid the credit situation.

There are ten or twenty million people who earn a fair surplus, over and above their ordinary needs. They are the real keys to progress. They have money to spend, whereas the rest of the population still lives too close to necessities and the ordinary comforts of life. These ten or twenty million people practically run the country; they are the people who perform the more important work. They read the magazines and newspapers, are intelligent, alert, and, have formed the habit of progress.

We began to realize that if we could interest, fascinate and convince this public that our inventors, scientists, artists, designers, engineers, manufacturers and builders are alert and progressive, that they are producing new and improved merchandise much faster than the old wears out,—then we could start a new era of progress. All we wanted was the public acceptance of the change. Only in this way can we continue to stimulate these creators, and continue to climb new

heights of prosperity to be shared by everybody.

We have the workers, great factories, sales and advertising organizations. What is their purpose if they fail to sell what their brains produce? Why should we educate and train men to create new things if people merely reply that they are satisfied with what they now have? The real job of research and the real hope of progress is to *make people dissatisfied with what they have*. Advertising men have been hammering this idea for years. But it is surprising how many people still hesitate to accept it.

It is human to resist change, but the greatest glory that we can ever possess is that we do change and have thrived upon progress. As Hoover has put it, we want nothing "frozen" in America. Let an inventor produce a good thing and we adopt it instantly. We have no false beliefs about old things.

This trend is even noticeable in Europe. Not long ago they started rebuilding the famous Bank of England, which, for hundreds of years, has occupied a building so unmodern that Englishmen humorously referred to it as "The Aquarium," or the "Old Lady of Threadneedle Street in hoopskirts."

Holding fast to ideas until they wear out is not the American tradition, not the American path to progress. What did Carnegie do? He seized from England the world leadership in steel production, which we have since retained, by breaking away from the old methods. Carnegie made the steel industry by his tremendous application of obsolescence. He more than once erected a new and expensive mill only to tear it down again to be able to manufacture steel by a new and better process. This is one of the great means of advancing business—to move so fast that competitors are left behind and made obsolete.

This is just what American industry has done to all the rest of the world. Our industrial supremacy has to a large extent depended upon our ability to inspire changes. In the future our greater prosperity will depend upon our success to create millions of buyers who will practice obsolescence in their purchasing.

Nothing is more clearly demonstrated than the fact that the prosperity of the masses, as well as the classes, depends upon our success in inducing the people who can afford it to buy new and improved goods.

Some people seem to have a hard time realizing that we are no longer an agricultural nation. They seem to forget that we are living in an industrial age, and that the factory is the chief cornerstone of our prosperity.

It is essential that we maintain high standards of living, if we wish to keep our factories active. When a research

man, an engineer, a designer, and a manufacturer combine their brains and produce something new, striking, colorful, more efficient, and labor-saving—shall we turn indifferently and say that the old is good enough, and keep a grip on our pocketbooks? Not if we realize that we live in an industrial age. Our pocketbooks won't stay well-filled very long if we pursue such a policy.

Success depends upon the readiness of the public to buy new things! We must spread more widely by high wages and greater efficiency, and thereby increase the number of people who are ready to buy new things before the old wear out.

The obsolescence policy always creates more surplus earnings for more people. Manufacturers lower their prices and consumers release second-hand goods for other users who could not afford to buy them at the original prices. By this process we have at last a prosperous circle.

We once had the sad spectacle of declining production, declining consumption, therefore declining wages, and so on, in a "vicious circle." This is what caused panics in days gone by. Today, by the speeding up of obsolescence we have more production, more consumption, therefore higher wages; and the circle becomes wider all the time instead of narrower.

If this spirit of progressive obsolescence becomes generally accepted, a great many of our most difficult problems will be solved.

Some may argue that obsolescence means waste. Certainly it means waste! Whenever you tear down an old building; discard last year's suit of clothes, or old equipment, it means waste. There is some service left. But we must look at the question of waste intelligently.

What would happen if women decided that it was wasteful to buy new clothes simply because the old ones could still be worn. Such a policy if continued would nearly ruin business. Who cares if women's dresses are not worn until they are rags? Or you might put it this way: who would care about the women if they dressed that way?

The principle is exactly the same wherever you turn. Progress and satisfaction necessarily involve waste, but only in order to achieve the results which more than offset the waste.

The woman who throws out her old kitchen enamelware, and substitutes for it the new colored utensils, is wasting something, but she is gaining far more, and so is industry and prosperity advancing. The man who casts aside his wooden filing cases and replaces them with steel is wasting, I grant you again; but he gains more than he wastes. The family that tears down the old frame house and builds a modern home is wasting, some may say, but what is a lot of old used lumber and junk as compared to the joy, health and

satisfaction which this family receives from the new home?

As Americans we have developed the principle of *creative spending*. It is the same with waste. We need to do more *creative wasting*, in order to promote greater progress. Nothing is more important than this. We should keep our eyes on the *gain* side, not on the *waste* side of obsolescence.

The struggle in all history has been to induce people to scrap old ideas without believing that it was wasteful to do so. The world has suffered far more in retaining the old moss-backed ideas and goods than by adopting the new ones.

The most important undertaking in business today is to convert more men to understand and use obsolescence, to scrap old machinery, old methods and ideas. We must have courage to face the problem of waste as related to progress, and to solve it intelligently.

We are becoming *technically expert in avoiding waste*. Thanks to President-elect Hoover we do not make so many sizes and models and we are experts at reclaiming old iron, steel, and rubber. There are some articles that avoid any waste in obsolescence. The automobile usually passes through two or three hands before it is scrapped. Anything made of steel is peculiarly adapted to an age of change or rapid obsolescence.

In steel construction for buildings a remarkably low waste is necessary. The steel of old Madison Square Garden after all of its 30 years of service, was preserved and some of it was used to construct a large stadium.

"Trading in" is a method in use for many other articles. A California department store has added a "trade-in exchange" for all varieties of second-hand household goods. We must not forget that the used car, radio or vacuum cleaner assists somebody to obtain a higher standard of living.

Nothing could be more absurd in a live industrial age than for everybody to retain the old *utility era* when he wore everything out. I have referred to Carnegie and how he and other masters of American industry made this country great by refusing to use old machinery and plants. Their policies are now an accepted industrial doctrine, and the Government is now promoting a survey of obsolescent factory equipment.

It is generally conceded that 45% of our factory equipment is obsolete. This significant fact is interesting,—the number of corporations in the United States which showed a deficit instead of a profit in 1926, according to the latest corporation tax returns, is also *exactly* 45%. You can put two and two together. The factories which are throwing out old things and putting in the new modern equipment

are the factories which are making the profit.

There is one industry which consists of 28 manufacturers. Only one company is a consistent moneymaker, and it produces goods at 25% under competitor's costs, because of its modern machines. It uses 94 factory employees per million dollars worth of output, whereas all of its competitors use at least 140 men for the same volume. Do we need any more convincing argument?

What is true of the factory is true in principle of us all as consumers. We are more prosperous when retailers, professional men, and consumers—even the housewife in the kitchen—diligently practices obsolescence, and buy new and modern goods as liberally as their income allows, and patronize the work of our creators of goods and services. After all, who does it mean but yourself?

We invite trouble when we are imbued with the idea that we alone can beat the game, taking but never giving, selling but never buying.

We have made a fine beginning by practicing obsolescence in the factory. But now we must go further; we must increase the number of consumers who practice it, and in doing so, we increase and spread wealth. Look what the automobile industry has done with this obsolescence principle! There is not another article costing as much as an automobile which has ever been sold as universally. We now *actually* have an automobile for every family in the United States, whereas vacuum cleaners, washing machines, radio, etc., are sold only one for every three to six families. This was accomplished by rapid obsolescence, of course. There are now half a million people, or more, who buy a new model every year and trade in their old car. This is absolutely revolutionary and unheard of as a buying habit.

These purchasers know what they want. There has been so much improvement and new value offered each year by the manufacturers that the new model is decidedly worth buying. And there you have the whole thing in a nutshell.

Not even Henry Ford could fight obsolescence—he had to give the people the new designs they wanted, something more than cheap travel mileage, which he started with. "You can have any color you want so long as it is black," Ford used to say. But you ought to see the colors he is offering now!

The American woman is largely responsible for this. Walter Chrysler won his magic success by designing his easy steering models, strategically intended to make driving simpler for women. Thus he obtained an advantage over other automobiles and made them obsolete. It was the American woman who demanded the

self-starter, the closed car, the luxurious upholstery, the color and comforts that made the Ford and other cars obsolete. Woman rules the merchandising world today, and few men are hardy enough to buy even a dog or an automobile or a suit of clothes without bringing their wives along. Style and modernness are woman's bywords. Catch a woman wearing things for utility's sake alone! It is the American woman who has made advertising what it is today, and she is satisfied. It is the American woman who is the quickest to respond to advertising; the American woman who most appreciates the new and the beautiful, and the American woman who practices obsolescence. She is more progressive than the American man, because she has greater fearlessness, and is less easily satisfied.

She has taught us that if we are to have prosperity we must *inject beauty into mass production*, and remake our tin-lizzy world into an artistic world; a world of color and style and convenience, comfort, even luxury. Up to ten years ago we were all, except the very rich, busy trying to make enough money to buy the plain unadorned *utilities* that we wanted. We wanted an automobile—just an automobile that would take us where we wanted to go. We wanted this, that, and other things—just the usefulness of it; we were satisfied merely if it worked.

Think what this means. It is a silent revolution, a great cultural movement that every educated person has dreamed about and longed for. It is a day when even the servant girl in the kitchen will thrill to the beauty of color—and which she really does today; a day when the things we turn out of our factories begin to have the beauty that things had in the days of handcraft; when the buildings and bridges we put up are no longer eyesores, but wonderful combinations of service, economy and beauty.

Today our American architects, steel construction engineers and builders have accomplished what the whole world unanimously admits is the greatest American artistic achievement of the century—the American skyscraper. This is not my opinion, but the worldwide verdict of those qualified to know. It is the most outstanding of all the examples of obsolescence, for the steel skyscraper not only made all other large buildings obsolete, but is turning obsolescence into economy instead of a waste.

Obsolescence is what obsolescence does, and it may be waste when mere whim and caprice dictate change. In New York City today they are tearing down some skyscrapers that were the last word only a few years ago; the *Pictorial Review* Building, for instance, which was built of

the finest fireproof steel construction at a cost of two millions in 1919. A building three times as high is going on the site which has become too valuable for such a moderate size building, without up-to-date arrangement and design.

The steel skyscraper, like the good automobile, has a high salvage value. The steel in the Savoy Hotel recently torn down in New York has been used in a hotel in Cuba. No other form of building construction permits such economy, in our rapidly changing times.

It is not the steel that becomes obsolete, but the design of the interior and exterior equipment, due to increased demand for service in buildings. The size of the building may also become obsolete because of the increased land valuation, calling for greater income. Steel is King today, and we properly call this the Steel Age, because steel is the most flexible material possible for an age of rapid obsolescence.

We are conscious today of design and artistry even in bridges, and many cities and towns want to remove some of the horrors that were erected in days gone by. A bridge can be a beautiful civic improvement. If built of steel it is easy to replace with a steel bridge of new and beautiful design, one which will, in turn, be easy to displace if we rise to still greater artistic levels. Obsolete steel bridges may be salvaged, sold and re-erected.

We must see clearly *the industrial meaning of this new art consciousness*. It is revolutionary and remarkable; the greatest prosperity producer that we have on our horizon. It forces obsolescence. Who wants the horsehair sofa today? Who wants the gingerbread house they built in the 1870's? Who wants wooden bridges, wooden cars, wooden office files, buggies, or bustles? Yet hundreds of millions of dollars worth of such old things still exist and are being used. It is a drag on culture, a ball and chain on profits, on wages and employment, and an obstacle to personal efficiency and satisfaction.

We must make people want to change for new and modern goods. The more we make people alert and beauty-conscious, the less are they going to be satisfied with this old junk and the faster the wheels of industry will hum.

Advertising men are the prophets and the educators of the new idea and the new attitude. They understand the public and the public depends upon them. They are leading the people to greater wealth and prosperity by the use of these new tools. Our greater prosperity rests with us if we will only consent to modernize.

We could keep every wheel turning for ten years to come, simply to replace the obsolete factory equipment, and without

encouraging over-production. The principal difficulty will never be over-production. The trouble is *under-consumption*.

We have been *production-minded* long enough; we must now become *consumption-minded*. It is absurd to say that we do not want an electric refrigerator or a motor boat or a beautiful home. We do, and we know we do. What about the 93 million people who still earn barely enough to maintain health and decency, without surplus for comforts and luxury? We are inclined to disregard the facts, and conveniently forget that in spite of the 20 million people with some surplus, there are nearly five times that number of people with scarcely any surplus above a common decent living. Many of them own automobiles, but they use them for economic production more than for pleasure. We must expand their wants and their capacity to pay for new goods.

The old-time economist and business man failed to consider any such possibilities. The modern employer takes the responsibility for unemployment conditions. We must go further, as some have already, and assume that we must take on the responsibility of providing a larger income for these people, and for selfish business reasons, in order to increase consumption.

We must make the present standard of living obsolete. We want people to build modern homes, with up-to-date kitchen equipment and artistic furniture. We are weary of seeing our factories working at half their capacity while three-quarters of the people need and would like to buy the goods these factories are so well equipped to produce.

We scorn the fact that 75% of all our business buildings are obsolete, 66% of our homes; while 75% of our home furnishings, 50% of our office furniture and equipment and 45% of our industrial equipment is also obsolete. We know that the salvation of industry, which has a capacity for producing 80% to 100% more goods than is now consumed, is to foster still more the principle of *progressive obsolescence*; that is buying for efficiency and style *rather than for the last ounce of use*.

We know that *if we are to keep large-scale production, there must be large-scale consumption*. We must fully utilize our modern factories, or *slow them down or shut them down*. A way to keep going is to foster the spirit of style, color and change in our purchases and thereby encourage the ever-changing whims and fancies of a fickle public.

The new modernistic art trend, which is a basic style change, affecting all industries, is an illustration of this new spirit. The public are always ready to express their artistic ideas and needs, and to discard the old.

Every time the consumer approves something new it means that a factory is busy, and we have high wages and full employment.

We must teach more people the pace of modern life. A quarter of our population is living in the twentieth century, but half of them are still living in the nineteenth century.

There is no point in perfecting new products *unless they are widely used*; unless the old are either thrown away or traded in to be passed on to a lower level of consumers.

Those who constitute the ten or twenty million consumers who have a surplus are the real progressive leaders. We no longer buy a house to live in until we die; a refrigerator to keep until it falls apart, an automobile until it refuses to go, or a radio that brings in but one or two stations. We want stylists in stores and factories, artists and designers in shops and industry to produce the new creations, not for a few people but for the greatest number.

We must not concern ourselves about waste in an era of scientific progress. The more scientific, the less waste, and the more we appreciate the artistic, the sooner we realize that all old must give way to the new. The net result will produce busy factories, high wages, more advertising, and a constantly increasing number of satisfied consumers.

We should visualize our factories hard at work remodeling our merchandise; using advertising to make the people of Bean Center, Texas; Black Bottom, Florida, and Snake Hole, Idaho, just as proud of up-to-date clothes, just as sensitive to the fine things of life, good houses and artistic furnishings as the people of New York or San Francisco.

When that day comes, and I believe it will in my time, the volume of consumer goods will be positively stupendous, and so will the volume of income for us all.

There is only one sure road to that great practical achievement, and that is the speeding up of progressive obsolescence.

We are a restless people. We do not live contentedly with out-of-date things; we refuse to allow a few of the people to enjoy the benefits of art and science. We will be restless until the humblest workman in America has a surplus that makes him capable of buying our mass production.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship, it is going to miss by just that much the pulling power it ought to have.

IT IS VITALLY NECESSARY THAT AIR TO BE BREATHED CONTAINS THE PROPER AMOUNT OF MOISTURE

The introduction of the proper humidity into the air will go a long way towards heading off FLU, GRIPPE and COLDS. This is the opinion of Dr. Bundeson, head of Chicago's Health Department, as well as many other noted health authorities.

These men urge the necessity of evaporating at least one-half gallon of water daily per average room during the heating period.

Therm-O-flectors, aside from expensive mechanical equipment, are perhaps the most efficient humidifiers available. The reason, of course, is that Therm-O-flectors are made, sold and installed by engineers who have had experience with all types of humidifier equipment and know the fundamentals of air conditioning.

The J. D. Gerken Co. is the largest manufacturer of radiator furniture in America, and the oldest in Philadelphia.

Therm-O-flectors are guaranteed to keep walls and hangings free from radiator dirt. They are attractive furniture (made of steel) and they do not sacrifice any of the heating efficiency of the radiator.

Costs are reasonable. Estimates free.

Without charge or obligation, the J. D. Gerken Co. will furnish an expert to make a hygrometer test of the air conditions in homes.

Therm-O-flectors have been approved and installed by many institutions—notably, Mitten Building, Methodist Episcopal Hospital, Bell Telephone Co., Horn & Hardart Co. Over 10,000 are in use in the Philadelphia district.

BRASS PIPE IN BATHROOM WILL PREVENT TROUBLE

How many times should a bathroom be "plumbered?" It should be "plumbered" once more if it is an old bathroom of the tin-tub, iron-pipe era. Call in your plumber and have him rip out the old, insanitary fixtures and the rusting iron or steel pipe and put in modern fixtures connected with good brass pipe that can't rust or corrode.

If you are building a new house it should be "plumbered" just once. Put in brass pipe to begin with.

You can't afford to run any risk of your water pipes rusting out or filling up when they are concealed behind expensive tiled or plastered walls or run under hardwood floors, as they are in modern houses. Brass pipe will last as long as the house stands and you'll always have a full flow of clean, sparkling water.

**"The Oldest
American
Fire and Marine
Insurance
Company"**

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

PHILADELPHIA

and the

Indemnity Insurance Company of North America
write practically every form of Insurance, except life

"ANTI-HYDRO" Prevents Brick Mortar from Freezing

The brick masonry in this building was laid during freezing weather with the aid of "ANTI-HYDRO".

In addition to preventing the mortar from freezing, "ANTI-HYDRO" made it permanently waterproof, and prevented the possibility of efflorescence coming from the mortar and staining the walls. "ANTI-HYDRO" does all this for you—in one operation and at one cost.

"ANTI-HYDRO" is an easy-to-use liquid compound which permanently waterproofs and hardens all portland cement mixtures. It lowers the freezing point of concrete to 15 degrees F. Enables you to work right through the winter, without the usual cold weather delays and penalties for uncompleted contracts.

To use "ANTI-HYDRO" simply add it to the water used to wet down the mix. Any unskilled laborer can do it. Results are guaranteed.

For 24 years "ANTI-HYDRO" has been known for its faithful performance. Use it on your next job.

WHAT

Would happen if all promotional work for better plastering would cease? Would our industry suffer? Think of the many substitutes for plastering that are being put on the market.

Let's get together and work together for the betterment of the plastering industry.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

New Jersey Construction News

Bath House and Recreation Building, Gloucester, N. J. Architects, Lackey & Hettel, 5 Hudson avenue, Camden, N. J. Owners, Camden County Park Commissioners, care of architects. Brick, cinder block, 1 and 2 stories, 30x80 feet, tile roof, cement floors, roof ventilators, waterproofing and dampproofing, electric lighting, steel sash. Plans in progress.

Residence, Paulsboro, N. J. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owner, name withheld. Brick, 2½ stories, 24x36 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Plans in progress.

Store and Apartment House, Merchantville, N. J. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owner, name withheld. Brick, steel, 3 stories, 34x93 feet, slag roof, oak and linoleum floors, roof ventilators, vapor heat, electric light, tile work, skylights, store front, fire escape (iron). Plans in progress.

Bungalow, Haddon Heights, N. J. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owner, N. J. Meyers, care of architect. Brick, 1 story, 24x42 feet, asphalt shingle roof, pine floors, hot air heat, electric light. Plans in progress. Architect will be ready for bids at end of week.

Apartment House, Boulevard avenue and Bradley street, Camden, N. J. Architects, Lackey & Hettel, 5 Hudson avenue, Camden, N. J. Owners, Forest Hill Parkside Apart-

ment House Company, care of architects. Brick, timber, 3 stories, 150x84 feet, slag roof, pine floors, roof ventilators, flagstone, east stone, incinerators, area gratings, wrought iron pipe, ornamental iron work, iron stairs, fire doors, tile and marble, steam heat, electric light. Owners taking sub-bids at architects' office.

Residence, Trenton, N. J. Architect, W. A. Klemann, First National Bank Building, Trenton, N. J. Owner, Joseph Lavine, care of architect. Brick, 2½ stories, 29x36 feet, slate roof, hardwood floors, hot water heat, oil burner, electric light, tile work, wood casements. Architect will be ready for bids at the end of this week.

Arcadia Cafe Building, 12 Hudson street, Camden, N. J. Architect, Harold A. Allen, 526 Stevens street, Camden, N. J. Owners, Arcadia Cafe, 529 Federal street, Camden, N. J. Brick, limestone, steel, 3 stories and basement, 90x19 feet, bond, excavation, stone foundations, marble, tile and terrazzo floors, steel sash, carpentry and mill work, painting, glazing, electric work, composition floor (Acme Asbestos, Covering & Flooring Co. or equal), skylights (G. Frowne Co.), plumbing, hot water heat, Johnson oil burner, boiler (American Radiator Co.), Corté radiators, dumb waiters (Energy Elevator Co.), metal lath, plastering, slag roof. Architect taking bids due February 28th.

Church, South Orange, N. J. Architects, Maginnis & Walsh, Boston, Mass. Owners, Church of Our Lady of Sorrows, South Orange, N. J. Stone and steel, 1½ stories and basement, 95x180 feet, slate roof (plumbing, heating, electric reserved), cement and maple floors, metal lath, tile, marble and terrazzo work. Architects taking bids due March 1st.

Warehouse and Loading Shed, New Brunswick, N. J. Architect, George S. Kingsley, 103 East One Hundred and Twenty-fifth street, New York. Owners, Sisser Brothers, New Brunswick, N. J. Reinforced concrete and brick, 5 stories and basement, 100x100 feet, concrete slag roof, concrete floors, rolled steel sash. Architect taking bids due March 2nd.

Naval Armory, Perth Amboy, N. J. Architects, Division of Architecture and Construction, Trenton, N. J. Owners, Department of Institutions and Agencies, William J. Ellis, Commissioner, State House, Trenton, N. J. Brick, steel, 1 and 2 stories and basement, 133x61 feet, wood pile foundations, reinforced concrete, membrane and integral waterproofing, steel stairs, iron work, maple floors, black slate roof, slag roof. Low bidder: G. W. Mercer Construction Co., Perth Amboy, N. J., \$95,000. Plumbing: Burns, Lane & Richardson, New Brunswick, N. J., \$5,468. Heating: John Mellen, Irvington, N. J., \$5,890. Electric, Buhl-Caffrey Co., Newark, N. J., \$3,909.

Road Work, New Jersey. Owners, State Highway Commission, A. Lee Grover, Chief Clerk, Broad Street Bank Building, Trenton, N. J. Route 3, Sec. 2, Paterson Plank Road Relocation in Secaucus and East Rutherford in Bergen and Hudson Counties. Route 44, Secs. 3 and 4, Bridgeport and Nortonville Causeways in Gloucester and Salem Counties. Owners taking bids due March 11th at noon. Deposit, \$10. Certified check, 10 per cent.

New Jersey Contracts Awarded

Central Power Plant, State House, Trenton, N. J. Architects, associates, J. O. Hunt, Hunt Building, Trenton, N. J., and H. A. Kelly, 921 Bergen avenue, Jersey City, N. J. Owners, State of New Jersey, State House Commis-

sioners, State House, Trenton, N. J. Stone, reinforced concrete, steel, granite, 2 stories, 55x100 feet, concrete roof and floors, roof ventilators, bond, grading, metal sash, tile, metal lath. Contract awarded Karno-Smith Construction Co., Broad Street Bank Building, Trenton, N. J.

Alterations to Building (two-story add.), Store Building, Broadway and Pine street, Camden, N. J. Architects, Lackey & Hettle, 5 Hudson avenue, Camden, N. J. Owners, W. L. Hurley Co., on premises. Brick, limestone, steel, 2 stories and basement, 50x48 feet, slag roof, maple and cement floors, steam heat, electric light, metal lath, ornamental iron work. Contract awarded Camden Construction Co., 505 Lawrence street, Camden, N. J.

Sewage Treatment Plant, Earlton District, Delaware Township, N. J. Engineers, Remington & Vosbury, Camden, N. J. Owners, Delaware Township Commissioners, Mrs. Wer-muth, secretary, Earlton, N. J. Brick, 1 story. Contract awarded Vincenzo Di Fran-cesco, Llanerch, Delaware County, Pa., \$66,492.50. Work to be started end of March.

Garage (add. and alts.), 1000 Haddon ave-nue, Camden, N. J., \$3,200. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owner, Mary L. Kenny, care of architect. Brick add., 1 story, 3x16 feet, garage, 1 story, 15x16 feet, slag roof, electric light, cement work. Con-tract awarded George L. Anderson, 401 Franklin avenue, Collingswood, N. J.

Residence and Garage, 1212 North Twenty-second street, Camden, N. J., \$5,500. Archi-tect, private plans. Owner, H. G. Remmers, 1200 North Twenty-second street, Camden, N. J. Frame, 1½ stories, 24x36 feet, slate sur-face roof, hot water heat. Contract awarded Thomas H. Miller, Merchantville, N. J.

Bridge, Route 29, Sec. 2A, across Stuyves-ant avenue, Union County, N. J. Owners, State Highway Commission, A. Lee Grover, Chief Clerk, Broad Street Bank Building, Trenton, N. J. Contract awarded Mundy Pav-ing & Construction Co., 226 South Warnock street, Philadelphia, \$93,855.81.

Miscellaneous Construction News

Auditorium, Newark, Del. Architect, Charles Z. Klauder, 1429 Walnut street, Phila-delphia. Owners, University of Delaware, Newark, Del. Brick, stone. Plans in progress.

Remodeling Buildings, Juliens Creek, Va. Architect, James A. Wetmore, Treasury De-partment, Washington, D. C. Owners, United States Government, Navy Department, Wash-ington, D. C. Low bidders: Austin Engineer-ing Co., 566 South Boulevard, New York City, Item 1, \$42,500; Item 2, \$6,000. Evans-Fal-cone Co., 1420 Walnut street, Philadelphia, Item 1, \$47,365; Item 2, \$6,987.

Office Building, 10th and Market streets, Wilmington, Dela. Architects, Hood, Godley & Fouilnoux, 40 W. 40th street, New York. Owners, DuPont Building Co., Market street, Wilmington, Dela. Fireproof, brick, steel, frame, 4 stories. Sketches in progress. De-tails undecided.

Miscellaneous Contracts Awarded

Building, Wilmington, Del. Architect, pri-vate plans. Owners, Hajoca Corporation, J. Harvey Boston, president; Frank W. Dows, treasurer, Thirtieth street below Chestnut street, Philadelphia. Cinder block, brick and steel, 2 stories and basement, 50x100 feet, hot water heat, slag roof, electric light, rolled

steel sash, ornamental iron work, composi-tion and yellow pine floors. Contract awarded Franklin M. Harris, 1520 Parrish street, Phila-delphia.

STANDARIZING GOOD PRAC- TICES IN THE CONSTRUC- TION INDUSTRY

*An Address by F. H. FRANKLAND, M.
AM. Soc. C. E., Manager of Techni-
cal Services, American Institute
of Steel Construction, Inc.*

Until recently Boston forbade the con-struction of skyscrapers, yet Boston was troubled with as great a congestion prob-lem as any city in the U. S. This is an in-teresting fact to contemplate inasmuch as we so frequently hear that the skyscraper is causing city congestion and the height of buildings should be limited. London attempted just that through its antiquated building regulations, and yet London has a more serious traffic problem than New York.

Now that the restrictions are off, Bos-ton is building a new North Station which, in its now incompleated form, pro-vides restaurants, a sports arena and a terminal for all kinds of traffic. Later a hotel will be added. And persons visit-ing Boston for attendance on a prize fight or other big meeting need never leave the building and will not be compelled to wade through the thickly congested streets of the city. In Chicago a similar undertaking, in what is known as the Ap-parel Mart, is being planned. Structures such as these are relieving the traffic con-gestion in cities. But it is obvious that would have been impossible of accom-plishment had the builders been restricted by harassing laws and regulations.

Many other significant instances could be cited to you to prove the necessity for a better education of the public into the problems of construction and of build-ings. Our troubles come very largely through ignorance or prejudice. We must remove them through a campaign of consistent education and a frank dis-closure of the details of our operations.

The American Institute of Steel Con-struction, which I am pleased to represent today, was organized for the primary purpose of relieving the ignorance of the public in regard to structural steel. The organizers of this association felt that

they were working with a material that is unsurpassed in efficiency, a material whose chemical properties are as purely concocted as the drugs upon the shelves of the apothecary.

Previous to 1885 a very limited amount of structural steel was used in building construction. Up to that time most of the iron used for construction purposes was employed in bridge building work, and consisted almost entirely of wrought iron and cast iron. About 1885, however, there developed in this country the com-mercial possibility of producing large in-gots of steel from which could be rolled various structural shapes that have re-sulted in a complete revolution of our bridge and building industry. An entirely new era of human history came into ex-istence with the transition from the Iron Age to the Steel Age, and this has been accompanied by one of the most remark-able industrial developments which the human race has ever experienced.

The various rolling mills producing the hot metal which they rolled into struc-tural shapes, employed talent from the then existing bridge industry to prepare

data on the proper use of structural steel for bridge and building purposes, and this data was published in the form of mill handbooks which constituted one of the greatest contributions that any industry has made to public development.

Little or no information existed as to the proper standards that should be used for this new product, and the engineers employed by the various mills adopted at that time a basic unit stress of 16,000 pounds, but unfortunately overlooked the fact that the manner in which this basic unit stress is used is sometimes more important than the unit stress itself.

The various city officials throughout the country based their building code requirements on the 16,000 pound unit stress appearing in the original mill handbooks, and this phase of steel construction soon passed under the influence of legal requirements. It has been claimed that the waste in our national industries is responsible for approximately \$100 per capita per annum in our living expenses. This in itself amounts to approximately \$11,000,000,000 per annum for the nation. It is useless to suppose that all of this can be promptly eliminated, but there is no doubt that a large reduction can be made.

About forty years ago, or in 1885, it became commercially possible to attain temperatures which resulted in the production of steel ingots of such dimension that rolled structural shapes could be made from them. Since that time there has been greater and more revolutionary changes in our industrial processes than in any previous two thousand years of history. We are standing so close to the threshold of a new era, that it is difficult to accurately appraise the great changes through which we are passing. Almost everything that we consider essential to modern conditions has been developed since that time.

In the meantime Bessemer steel, which constituted the original product, was found to have undesirable physical properties, as then produced, and there immediately developed the Open Hearth process, which eliminated the undesirable physical properties met with in the Bessemer material as then produced.

The bridge engineering talent which devised the original mill handbooks recognized, in adopting their standards, that

little was known of the new field in which the material would be used, that the talent qualified to direct its uses was very limited, and that little consideration was given to the proper selection of live loads and the determination of such stresses as those caused by wind, impact, and secondary conditions.

As experienced and skill developed in the talent directing the uses of steel, it was immediately recognized that the 16,000 pound basic unit stress interfered with the attainment of the full economies possible through the use of structural steel, but they were confronted with the existing building codes restricting the conditions in this branch of the industry. The other branch of the industry, namely that of bridge construction, had not come under legal restrictions, and engineers in this class of work took advantage of the economies which were possible.

It will be noted also that, up to a very recent date, the engineering profession has attempted to take care of their lack of knowledge of the effect of live loads by modifying the unit stress. Modern practice, as represented by the American Railroad Engineering Association ruling uses the same stress for both live and dead load, and provides a formula for converting the live load into the equivalent static or dead load stress.

It will be noted too that the practice of using increased working stresses in steel is not the result of the competitive influences of other materials of construction, but is based upon the economic conditions of the material used.

Individual whims have resulted in almost every form of irresponsible practice, which tends to break down fair competition and leave the responsible bidder, as well as the purchaser, in the dark as to whether his work is in competition with unit stresses, assumptions, omissions, or cost of production. This practice has gone so far that in some cities engineers have sometimes entirely neglected the question of live loads in order to meet competition, and as a result the structures are actually designed on stresses of 20,000 pounds or more, while the responsible competition are using much lower stresses. The chaos resulting from the development of such a wide range of individualism naturally results in serious economic waste of which the responsible

engineer, architect and manufacturer, as well as the owner, is the victim.

So many column formulas and other technical modifications of the basic unit stress have come into existence, that the leadership once established by the mill handbooks at the inception of this new era of construction has been lost; and it is evident that if fair competition is to be re-established, it can only result from the re-establishment of uniform standard practice.

The fabricating industry of the United States and Canada have a very heavy financial investment in plants and organizations, which are vitally dependent upon something being done to correct existing conditions.

We believe that it has been the thought of the United States Department of Commerce that the various industries involved in the necessity for standardization should be initiative in promoting this work. For this reason the American Institute of Steel Construction have been conducting a campaign which has already been recognized as constructive and effective in eliminating the evils of existing conditions. It was recognized when this work was undertaken that as far as possible, all questions of commercial domination should be eliminated, and for this reason a committee was selected from the leading talent in the engineering, architectural and academic fields to prepare a Standard Specification regulating the Design, Fabrication, and Erection of Structural Steel.

Another consideration which the American Institute of Steel Construction has realized is that the mere recommendation of a unit stress or a specification will not in itself result in uniform practice, and for this reason there has been prepared a comprehensive manual entitled "Steel Construction," presenting data relative to the application of this specifications to the numerous rolled structural shapes now being produced by the various mills, and incorporating in the same volume the Code of Standard Practice and the Standard Fireproofing Specification.

During the past year the Institute has been actively engaged in furthering the adoption of the Standard Specification in the comparatively few cities not yet on our list, which now includes 172 names.

Standard uniform practice in the design, fabrication and erection of structural steel is now in effect throughout most of the United States and Canada. During the years ahead the industry and the general public will experience, to an increasing degree, the benefits inherent in a more economical and efficient use of structural steel.

It must be recognized that the rolling mills, which have above been referred to, as the hot metal industry, are the source of supply to numerous cold metal indus-

tries between them and the public. Their handbooks have of necessity had to incorporate the numerous sections rolled for those various industries, with the result that the architectural and engineering industries are often at a loss to know which are properly classified as structural steel shapes.

It is the purpose of the handbook prepared by the Institute to incorporate data regarding those sections rolled by all of the mills, which are properly classified as structural shapes, and in this way eliminate many of the useless sections that properly belong to other industries. This will greatly reduce the amount of material necessary to carry in stock in the various fabricating plants, and at the same time result in more frequent rollings of the mills themselves. In addition to this the rolling mills will be able to eliminate many of the rolls now used with the corresponding economic saving.

The Institute has in this connection already standardized the dimensions for rolled structural steel slabs for column bases, which have been found by engineers very desirable for these purposes. The result has been that already a product which in the past has been undesirable from the mill's standpoint, has become a very desirable source of tonnage.

The data which is being prepared relative to the various structural shapes will show on one page all of the essential information relative to the use of any structural sections. The present mill handbooks have this information distributed on from six to eight pages, and in many instances consideration is not given to vital questions relative to the use of the section. With this information combined in one place, much has been accomplished in eliminating irresponsible or incompetent designing.

In the discussion as presented, nothing has yet been said of the effect which the incompetent designer exercises on the industry. It has been the experience of practically all building commissioners throughout the country that incompetent designers entirely ignore the fundamental conditions connected with the selection of proper material to carry the loads. These so-called designers lack the necessary talent to qualify them for the work which they undertake, and they are in many instances entirely incapable of understanding the significance of a unit stress or a specification regulating the use of that unit stress. Their processes are dominated by a system of guessing, and it is evident that no unit stress or specification at the present time has any consideration in their so-called design. It may be claimed by some that the unit stress should be low enough to make safe anything which this class of designer may contemplate; but it requires but little

thought to realize that no stress selected would accomplish this purpose. If it is supposed that this class of designer will attempt to modify his practices to take advantage of changed unit stresses, it will produce a wholesome effect, in that it will be the first effort he has made to consider any unit stress at all, and the ultimate result will be that in order to obtain the economies that are possible, he will consult with those competent and qualified to properly advise him.

This result is indicated by the experience of the Building Commissioner of the City of Boston, who states that previous to the revision of the Boston Building Code, practically all of the plans coming into his office ignored the proper consideration of stresses. In a written paper presented before the Building Officials' Conference in April, 1925, this Building Commissioner stated that one of the results already noticeable was the fact that under present conditions very few mistakes were being made.

Another result of the wide range of individual practice in various sections of the country is shown in the variation of the numerous physical conditions connected with the execution of contracts for this class of material. To correct these innumerable evils, the Institute undertook the preparation of a Standard Code of Practice, defining the various physical conditions relating to the execution of structural steel construction. Data was assembled dealing with local conditions in every section of the country, and after exhaustive study a proposed Code of Practice was issued to several hundred architects, engineers, manufacturers, and academic institutions. As a result of their criticisms and suggestions, the Code was revised incorporating these suggestions, and reissued. By the repetition of this process, there was evolved the present Code of Standard Practice which has been described as constituting

one of the most constructive contributions developed in any industry. It is clear in its definitions, fair to both the buyer and seller, and has already been adopted by numerous buyers and sellers as the basis of their contract obligations. It does not in any way deal with subjects that may be classified as ethics, but restricts itself to the definition of physical conditions intended to eliminate the innumerable misunderstandings and controversies that have existed in the past.

The full significance of the economic saving which is resulting from the work which the Institute is doing, is very difficult to accurately appraise. There is, however, a basic physical saving of from ten to twelve and a half percent of the steel required for construction purposes, which should amount to over twenty-five million dollars a year. In addition to this, there is an economic saving in the personnel of the fabricating companies of the country, in that under present conditions most highly talented and expensive men have been engaged in the defensive operation of studying the numerous specifications upon which they are bidding to determine if any unusual conditions are required. This talent can be converted into productive effort of the highest type. There are innumerable other incidents connected with the administration of steel construction that will be very materially effected in the adoption of uniform practice.

It must be recognized that in some instances it will be difficult to submerge individualism, but with the co-operation of the responsible elements which constitute a large part of the engineering, architectural, and manufacturing branches of the industry, it will be possible to attain uniform practice upon which fair competition is alone possible.

I have dwelt at no inconsiderable length upon our work in standardizing the specifications for structural steel for, as an

engineer, I believe this is one of the greatest contributions the steel fabricators have made toward the improvement of construction in this country. I am not alone in that belief, for it has come under my direct observation that the work of the American Institute of Steel Construction is being adopted in the best European practices.

In Europe the skyscraper was practically non-existent prior to the war. During the years since the Armistice reconstruction has been very slow. Today the housing problem is still depressingly keen, and the governments are being urged to take rather definite steps. Direct advances of public moneys for the building of new homes has not been sufficient. And in numerous instances the building codes of the leading European cities have been temporarily set aside so that a true skyscraper structure could be erected. American engineers trained in the designing of the skeleton-framed buildings have, within the past few months, been engaged to go to Europe to instruct the engineers there in our skyscraper art.

Prejudice against fabricated steel, based upon untenable assumptions, is being gradually allayed both at home and abroad. I feel that the American Institute of Steel Construction should be given credit for the efforts expended in proving to the public at large that the value of steel as a building material has not been sufficiently appreciated, that its merits are far superior to what was believed even by those in the construction industry who should have known better.

THOUGHTS ON "BID PEDDLING"

By J. B. OHLIGSCHLAGER, *President National Concrete Construction Co., Louisville, Ky., in The Associated Contractor*

The construction industry is one of the greatest, and those of us who are engaged in it can make it greater; but, in my candid opinion, this can only be done through organization and close co-operation. That we need co-operation is evident from this vital subject of relations to the sub-contractor; and the problem of peddling bids is as much the fault of the general contractor as it is of the sub-contractor. They are both to blame and it will take united action on the part of both to remedy this evil. It is this peddling of bids between the general and sub-contractors that gives the architect and owner the thought that he can do the same; and he usually does to his advantage.

A Good Slogan

There has, recently, a slogan cropped out, and I hope it will be put in red ink on every contractor's letter head, namely, "My First Bid, My Last Bid." When you have backbone to stand behind that

statement, the time will come when there will be no occasion to peddle the sub-contractor's bid. As the matter now stands, as soon as the general contractor has been awarded the contract, the subs come about to learn what low bid they have to beat. Whether or not the lowest bidder has made a mistake does not seem to interest them. The main point is wanting to learn what the amount of the low bid is, and it is seldom that the general contractor cannot set the price he will pay the sub-contractor. To my mind, this is why the general public thinks the profits are so enormous in the construction industry, and why the owners and architects expect you can always make a reduction when called in.

Contractors do not seem to want profits nowadays, but the height of their ambition is to get a contract. As I mentioned before, not only the subs, but the general contractors, seem to be using the same tactics.

Exchange Reorganized

At Louisville, we have recently reorganized a Builders' Exchange. We have had exchanges for the past thirty years. Good, bad and indifferent, but the contractors in Louisville always felt they needed one, and after many attempts have reorganized the Builders' Exchange, to which the sub-contractors are admitted. Each of the various sub-trades are represented on the board, and so far they have succeeded in organizing six or seven branches, who submit the bids to the secretary, at the same time they do to the general contractor. Having this bid on file with the secretary, it fixes the amount of the low bid in this branch. The other bidders are notified of the low man and the amount, and they are honor bound not to change their bid on file.

This method is now in operation with six or seven of the sub-trades, and seems to be working to the satisfaction of all. There is no objection to any bidder getting the work on his bid, provided he does not meet the low bid by cutting his bid. It is the hopes of the general contractors and sub-contractors that this method will soon be established by all the sub-trades in the building line. While they have not all the sub-contractors in the Exchange, their aim is to get the majority of the representative bidders and they are being assisted by the general contractors who urge all the sub-contractors to unite with the Builders' Exchange, the general contractor believing it is only by establishing the slogan of "My First Bid, My Last Bid." all down the line, that any good results can be brought about.

While we realize there will be some slips, but with the general contractors backing up and encouraging the slogan of the sub-contractors, the sub-contractor will not cut his bid very often before it becomes generally known.

We are firm believers in organization, realizing it is only through organization that we can accomplish anything, and are looking forward to the time when the construction industry in all of its branches will be organized like many of the successful industries.

Notice Sent to All Interests of the Building Industry

The following declaration of policy has been adopted by the membership of the General Contractors Association:

It must be positively understood that every bid tendered and every price quoted to any general contractor must be the lowest and best the first time. Any sub-contractor reducing his bid or any material dealer reducing his quotations, after any general contractor has submitted his bid, will be barred from figuring with or quoting to any member of the General Contractors Association. In other words, there must be no shopping by either party concerned.

It is believed that this declaration is plain enough to require no explanation. The Association is determined to break up peddling and shopping and will refuse to do business with sub-contractors and dealers who cut prices either to our members or others.

It is our confident expectation that every sub-contractor and dealer will refuse to quote any general contractor who will not subscribe to and abide strictly by the same terms as we have prescribed for our membership.

Yours very truly,
GENERAL CONTRACTORS ASSOCIATION,
D. R. LYMAN, *Secretary*.

POPULARITY OF BUILT-IN FEATURES IS EXPLAINED

The popularity of built-in features is explained by the fact that their compactness allows more space for the center of the room, and in this way saves the house from being crowded with an abundance of furniture.

Moreover, a large percentage of built-in features in one's home materially reduces its furnishing cost. This detail works to advantage in two marked ways. The occupant of the house may use the money thus saved for other purposes or he can divert it toward the purchase of more expensive furniture which otherwise would have been beyond his buying power.

The home owner is not limited to the use of varnishes and stains, such as mahogany, oak and walnut, but also may have the pieces finished in ivory or in the unlimited range of colors obtainable in enamels and lacquers.

Briefly, the built-in feature may be made to either harmonize or contrast with

the color scheme of the room, permitting the house owner to express his individuality and personality in a way that would have been difficult with stock furniture.

—*East Bay Builder.*

IN REPAINTING HOUSE MANY THINGS MUST BE REMEMBERED

Every executive knows that he must understand the fundamentals of the work which he directs if he wants a good job, that he must have a firm grasp of the methods employed if his supervision is to be efficient.

This is a universal principle which holds with as great rigidity in the home as in the office. From the commonplace tasks of routine household affairs to the intricate problem of constructing a home, a general knowledge of methods will be necessary for intelligent supervision.

When the property owner is ready to paint or repaint it will be well for him to have such knowledge. A few pointers on how to get a good job are worth remembering.

Surface preparation is the first thing to be considered. If the wood is either old or new and is in good condition, it will require only a thorough dusting to remove the loose articles of dirt. Possibly there may be a few rough places that will need scraping or sandpapering. The preparation in such cases is thus entirely simple. But a house that has been neglected until the paint becomes cracked and scaly presents a difficult problem.

Burn Old Coating Off

The old coating must be burned off before the new can be applied. As this is a task by no means simple and one that involves a fire risk, it is imperative that it be intrusted only to a painter who knows his job. If the surface is not carefully prepared, no amount of paint can give a good result.

Incorrect weather conditions are another factor which may completely spoil any job. If they are not heeded scaling and blistering will almost inevitably result.

When this occurs the tedious and expensive task of removing the faulty coating must be faced before another coat can be applied to correct the condition. Moisture is the most dangerous element. For the surface to be dry does not suffice. Often when frosts, fogs or snow have been present the condensed moisture is left in the wood even when it cannot be detected.

If paint is applied under these conditions it will become blistered when the temperature rises and the sun draws the moisture to the surface. Painting in the hot sun is also disastrous. Again, the temperature must not be too low. As a rule if the painter can do the job without great discomfort the weather will be quite warm enough to give good results.

Good Paint for Good Results

A last point to be kept in mind for exterior, indeed for any, painting, is that skimping is false economy. If three coats are recommended, and they always should be for new work, three coats will prove an economy. Again, good paint only can give good results. Poor products are just as expensive to apply and they are inevitably unsatisfactory. Finally, the painter must know his job.

For interiors the same general principles hold true. Surface preparation, however, is necessarily different for plaster and for wood. Plastered walls must first of all be treated for free lime, which if allowed to remain will cause spots to appear in the final finish. A solution of zinc sulphate, eight ounces to a gallon of water, applied with a brush, will eliminate this danger. After rough places on the walls are sandpapered and any cracks or small holes present filled with plaster of paris, they must be primed.

Otherwise the "suction" will leave the pigment on the surface in such a way that it will soon dust off. The best preparation for this purpose is boiled linseed oil or a good wall varnish.

The value of paint for economic and artistic purposes needs no elaboration. We all know the truth contained in the household phrase, "Save the surface and you save all." And the power of paint to

beautify is self-evident. But remember, if you want the best in economy, the best in artistic value, you must have the best application.—*East Bay Builder.*

PAINT AN INVESTMENT AND PAYS DIVIDENDS

It has been said many times that paint is an investment, not an expense; that paint pays dividends, and that money spent for paint is money ultimately saved.

At the word "investment" most of us think of stocks and bonds, from which we receive neat little coupons that have a cash value at any bank. It is a little difficult for most of us to conceive of paint in the same terms, but, as a matter of fact, paint is an investment and does pay dividends. What is more, it has been estimated by authorities that paint pays 12 per cent.

Of course, paint on your house issues no coupons, but careful consideration will show that, coupons or not, paint is one of the best investments a property owner can make.

The light reflecting properties of paint when used on interior walls, ceiling and woodwork, conserve daylight and decrease electric light bills by as much as 20 per cent. Painted surfaces cut down labor costs in the home, office, store or factory. Better lighting conditions prevent accidents and so cut down liability insurance. These three definite sources of saving make up at least a 1 per cent. dividend.

Aids in Sanitation

Of recent years it has been scientifically demonstrated that people work better in pleasant surroundings. More interest in the work, greater efficiency, and more initiative are apparent when working conditions are good. This applies both to home and business life. Surely the added zest that neat, attractive, well-painted surroundings lend, pays at least another 1 per cent.

Every civilized country is spending huge sums for sanitation. Sanitation means cleanliness. It means the wiping out of breeding places of mosquitoes and flies. It means the establishment of phy-

sical conditions that are undesirable for germs and vermin.

According to the health departments of a number of our largest cities, and in line with tests and demonstrations made by scientists, paint is one of the most efficient agents in making the home, office, factory or store clean and sanitary. A paint film closes the pores in plaster, seals cracks and spaces in woodwork, produces surfaces on which dirt and germs find poor lodging.

No one attempts to estimate the value of human life in dollars and cents. Sanitary conditions prevent diseases and death, reduce doctor bills, and avoid loss of income due to illness. Good health maintains a higher earning capacity. For all of these reasons, and because of the active part which paint plays in promoting true cleanliness, it has been estimated that in sanitation alone, paint pays 2 per cent. dividends.

Good Insurance Against Loss

Then there is the matter of beauty, which is just as difficult to estimate in dollars and cents as health. Many surfaces cannot be attractive unless painted. The full beauty of wood is never apparent until it is varnished. Nearly every surface in the house depends for its good appearance upon either paint or varnish. As for the outside, it has been estimated that good painting increases the beauty of many a building 100 per cent. In beauty, therefore, paint pays a 3 per cent. dividend.

Paint is the one best insurance against losses resulting from weathering and decay. Paint protects a house and keeps it in good condition. Weathering and decay alone, undeterred by paint, result in losses of over \$1,500,000,000 a year for neglectful property owners.

While most of us are willing to pay for fire insurance because of the sense of security which it brings, few of us realize that weather insurance is really more necessary because while fire rarely threatens, weathering and decay are constantly at work to lower houses into dust. It has been estimated that if a house is painted every five years its value increases about 5 per cent. at each painting.

Certainly the actual saving effected by paint, in preventing deterioration, is worth a considerable sum. In terms of property protection, therefore, paint pays at least 5 per cent. Add up the total and you have 12 per cent in actual, tangible benefits.

A 12 per cent. dividend is an unusual business proposition. Unlike other propositions of similar nature, neglect to invest in paint involves not only a loss of this large dividend, but incalculable losses in desirability, resale and loan values, prestige and many other things that home-owning involves.—*East Bay Builder*.

MASS PRODUCTION AND HEALTH

Whatever indictment might be charged against the present trend towards business consolidations and mergers, the development of powerful chain store systems and other super-enterprises, the really interesting and significant phase of this economic struggle is the steadily improving condition of the worker.

In spite of the many substantial indications of a great prosperity in this country, there are still those who are what the Wall Street professional would call "perennial bears"—confirmed pessimists who see nothing but the gloomy side of any situation. They decry the passing of the small retailer and wonder what he will do to fill his economic notch. They paint black word pictures of the diabolical connivings of organized capital and predict relentless slavery for millions of industrial workers.

The trouble with these alarmists is that they have truly lost their mental perspective and overlook some very important points. They forget that more has been accomplished during the last two decades in ameliorating the condition of the worker in industry than for centuries before. The twelve-hour day, which existed ten years ago, is history. Some of the more sanguine of labor and industrial leaders are looking forward confidently to the five-hour day, five days a week. Wage scales have improved despite a feeling in some lines that they could be still better. There is a changed relation for the better between capital and labor, due largely to a deeper and fairer comprehension of the other fellow's problems.

From a broad humanitarian viewpoint, however, a very vital fact is that actual working conditions have been improved immeasurably. Industry—highly organized for mass or quantity production—has found that it pays to protect the health of the worker by giving him plenty of light and clean air and by removing the causes which formerly were a menace to his physical well-being and made accident easy.

In many of the manufacturing processes of America's basic industries, dangerous gases, fumes and dusts are created but, through the adoption of modern methods of controlled ventilation and air conditioning, are mechanically collected and carried away. In the old days these poisons were allowed to harass the worker and sow the beginnings of tuberculosis, painter's colic and other scourges. They were the conditions, too, which permitted destructive explosions of gases or dusts or were the origin of death-dealing fires.

With the announcement recently that some of the largest insurance companies are taking a new interest in air and other health conditions in industrial plants,

office buildings and public garages, where thousands are employed, there are further reasons for encouragement. It is an actual fact, for example, that insurance companies have reduced fire and accident rates on plants where the risks have been lessened by provisions for air conditioning, not only for ventilation, but for the prevention of explosions and fires. The insurance companies are very materially interested in the public health and mortality figures.

How business men and the insurance companies generally are striving to further improve working conditions in factories was told to a group of engineers at a meeting in Detroit recently by W. J. Graves, consulting industrial engineer for one of the largest liability companies in Michigan.

"Much money has been spent and is being spent for equipment in an endeavor to better working conditions," he said. "More than ever before executives are realizing that better light and better air are factors in production. We breathe through the pores of the skin as well as through the nose and, therefore, air temperature and humidity become factors in production. The comfort of the worker depends on these factors. Thermometers in the work room should be used to gauge results. We are all agreed that man-power is the big essential element of production. We must take as good care of our workers as we do of our machines if our factory is complete and yields dividends."

DON'T FORGET TO CONSIDER COLOR OF WOODWORK

In any decorative scheme, don't forget to consider the color of the woodwork. When the wood used for window and door trim is oak, cypress, maple or birch or any wood with a beautiful grain, a waterproof varnish will give luster and bring out the grain.

Woods vary in shade from light to dark brown or red. The color scheme of the room should be kept in similar tones or warm colors. Contrasting colors can then be used in some of the furnishings to give the room animation.

Light woodwork is very fashionable, and there are excellent varnish stains and enamels on the market that will give just the shade or tint in the woodwork that the color scheme of the room demands.

Varnish stains color the wood and let the grain show through. Enamels give a solid coat of color that is rich and satiny in its texture. The range of colors is wide and manufacturers give explicit directions for securing any tint or shade desired. Of course the most satisfactory finishes are absolutely waterproof and can be washed without injury to gloss or color.—*East Bay Builder*.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

"ANTI-HYDRO" Prevents Brick Mortar from Freezing

The brick masonry in this building was laid during freezing weather with the aid of "ANTI-HYDRO".

In addition to preventing the mortar from freezing, "ANTI-HYDRO" made it permanently waterproof, and prevented the possibility of efflorescence coming from the mortar and staining the walls. "ANTI-HYDRO" does all this for you—in one operation and at one cost.

"ANTI-HYDRO" is an easy-to-use liquid compound which permanently waterproofs and hardens all portland cement mixtures. It lowers the freezing point of concrete to 15 degrees F. Enables you to work right through the winter, without the usual cold weather delays and penalties for uncompleted contracts.

To use "ANTI-HYDRO" simply add it to the water used to wet down the mix. Any unskilled laborer can do it. Results are **guaranteed**.

For 24 years "ANTI-HYDRO" has been known for its faithful performance. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

CENTURY OLD IRON AND STEEL COMPANY INCORPORATES

The Montgomery Iron & Steel Co., one of the oldest companies fabricating steel in the United States, has incorporated as of March first, the business, which prior to incorporation, was conducted by W. Nelson Mayhew and Samuel Frank and by W. Nelson Mayhew since the decease of Samuel Frank.

This concern has been operating since the year 1812, when John Joyce established a small blacksmith shop at 6th and Cherry Streets, Philadelphia, where he also was prepared to do bell hanging, machine work and to furnish sundry iron work for builders. Some years later he took into partnership one of his helpers by the name of O'Hara and the firm then became Joyce and O'Hara. This firm continued for a number of years, when we find a man by the name of John Steward, replacing Joyce, and the firm then became Steward and O'Hara.

Sometime in 1855, John B. Stevens, a

Park 4981

nephew of John Steward, and an employee of the firm, was taken into the company and the title was then changed to Steward & Stevens and remained that until the death of John Steward in 1881, when John S. Stevens continued the business alone. John S. Stevens was the first president of the Builders' Exchange of Philadelphia.

On January 1st, 1887, Mr. Stevens took into the firm his two sons, R. Steward Stevens and Wm. W. Stevens and the firm became John S. Stevens and Sons. In 1892 the business was moved from 6th and Cherry Streets to 9th and Montgomery Avenue, when the foundry business of Royer Bros. was absorbed, the name remaining the same. About 1895 John S. Stevens retired from the business, having in the course of his lifetime built the first skyscraper in Philadelphia, i. e., the Drexel Building at 5th and Chestnut Streets. He also erected the Masonic Temple, Post Office, Academy of Fine Arts and the Philadelphia Record Building and furnished most of the iron for the Public Buildings. The firm was continued by his two sons, under the name of W. W. & R. S. Stevens.

On November 15th, 1900, Harry F. Hannis, a bookkeeper of the old firm, was taken into the firm and the name was changed to Stevens and Hannis, and on October 1st, 1902, the partnership of Stevens and Hannis was dissolved, and a new firm created consisting of R. Steward Stevens, J. Franklin Stevens, W. Nelson Mayhew and Samuel Frank, trading as the Steward & Stevens Iron Works.

One of the new members of the firm, W. Nelson Mayhew, had entered the employ of the firm on May 19th, 1900, shortly after the death of Wm. W. Stevens. W. Nelson Mayhew, C. E. (M. A. M. Soc. C. E.) was born in Philadelphia on March 14th, 1880, and was educated

in the public schools of this city. He graduated from the Central Manual Training High School and the University of Pennsylvania, class of 1901, in the civil engineering course, receiving the degree of B. S. and subsequently C. E. Mr. Mayhew was early identified with the Builders' Exchange and was elected as member of the Board of Directors in 1913, in which capacity he has served until the present time. In 1920 he was elected President of the Exchange and served until the date of the merger with the Building Trades and Employers Association. At present he is one of the Vice-Presidents and member of the Board of Directors of the Philadelphia Builders' Exchange and Employers Association. He is also Vice-President and member of the Board of Directors of the Structural Steel Board of Trade of Philadelphia.

Samuel Frank, the other new member of the firm, was born in 1867 in Diebolshheim, am Rhine, France, and studied ornamental iron work in a number of the principal cities of Europe. He came to America in July, 1889, and worked in various ornamental shops in Philadelphia, including John G. Brill, Spooner & Fryer, Horn and Brannen, Merritt & Co., Belmont Iron Works, Edward A. Darby & Sons, Wm. Purlin and Chas. F. Biggin. In 1901 he started in business with Louis Wagner under the name of the Columbia Iron Works, renting a section of the plant of Stevens and Hannis, at 9th and Montgomery Avenue.

R. Steward Stevens died May 17th, 1913, and on January 1st of the next year W. Nelson Mayhew and Samuel Frank took over the business under the old name of Steward & Stevens Iron Works, moving the plant to 1712-26 North 9th Street. During the World War, this firm was cited and received the Distinguished Certificate from the Secretary of War.

On December 1st, 1912, Joseph N. Dalsen, Samuel Frank and W. Nelson Mayhew started the Montgomery Iron & Steel Co., at 1832-34 North 9th Street, later purchasing the entire block on 9th Street from Berks to Montgomery Avenue, and on April 1st, 1921, the Steward & Stevens Iron Works joined with the Montgomery Iron & Steel Co., and a new partnership was formed, composed of W. Nelson Mayhew, Samuel Frank and Jos. N. Dalsen, trading as the Montgomery Iron & Steel Co.

On January 1st, 1923, this firm was changed to W. Nelson Mayhew and Samuel Frank, continuing under the name of the Montgomery Iron & Steel Co., and on January 15th, 1925, the 9th Street property was sold to the U. G. I. Contracting Co.

On August 1, 1926, the firm moved their offices to 2500 East Duncan Street, Frankford, and on January 15th, 1927, the plant was located at the same point (the plant being the largest in Philadelphia, American Bridge Co.'s plant excepted).

On July 30th, 1928, Samuel Frank answered the call of the Great Architect of the Universe and the business was conducted by W. Nelson Mayhew, the surviving partner.

On January 16th, 1929, W. Nelson Mayhew purchased from the estate of Samuel Frank, deceased, the half interest in the Montgomery Iron & Steel Co., formerly owned by Samuel Frank.

On March 1st, 1929, the Montgomery Iron & Steel Co., a Pennsylvania corporation, purchased from W. Nelson Mayhew, all his rights, title and interest in the firm of the Montgomery Iron & Steel Co.

The Montgomery Iron & Steel Co. have fabricated and erected many build-

The officers of the corporation so far elected are: W. Nelson Mayhew, President and Treasurer.

John Mayer, Vice-President, in charge of plant operation, born June 3rd, 1880, at Temesvar, Hungary, studied ornamental iron work in Austria and Hungary; came to America in 1903; entered the employ of Steward & Stevens Iron Works, March 8th, 1905, and has been with the Steward & Stevens Iron Works and Montgomery Iron & Steel Co. continuously from that date.

Susanna Prince, Secretary, an accountant, who entered the employ of Steward & Stevens Iron Works on June 19th, 1920, and has been with the Steward & Stevens Iron Works and Montgomery Iron & Steel Co. continuously from that date as Secretary and Credit Manager.

Mr. J. F. Bradley, Granite & Cut Stone, formerly of 1121 Fillmore St., Frankford, Philadelphia, has moved to 4822 Roosevelt Boulevard, Philadelphia.

ROOF OFTEN RECEIVES LEAST CONSIDERATION

Father Time, that relentless old chap, is forever on the go. He never stops. Hour after hour, day after day, year after year, he grinds away, exacting his toll from all of us.

His gruff old captain, Weather, and those active lieutenants, Wind, Rain, Snow, Frost and Heat, are always on the job, driving away, destroying the works of man. So they will work on your home—trying—striving to tear down that which you build.

Man from the earliest dawn of history has considered his home the most important and sacred of all institutions which he has created. Always his aim has been to build a shelter from the elements—that was more and more permanent. Always has he attempted to defeat old Father Time and his destructive cohorts. Today he is nearing his goal. Permanent building materials from which he can erect nearly every part of his home are available—awaiting his call.

One of the most important items in the whole house—the roof—receives from many builders the least consideration. Yet it presents more surface for the attack of that destructive army, and, therefore, should be the best protected.

Yet is it? No, in many cases it is not.

The roof has been the point where home builders have often figured they could economize. Yet in practically every case it has proven to be false and costly economy. The necessary outlay for repairs, upkeep and replacement of a perishable roof is soon much greater than would have been spent in putting on a roof of permanence in the first place. Not only have these items cost him more, but beautiful ceilings and interior walls have often been ruined, mounting up his expense for their renewal and repair. And then think of all the trouble and worry.

Is it worth the few dollars saved on the initial cost to roof your home with a perishable roof? Wouldn't it seem as logical to build your walls of cheap, perishable material which would need renewing every few years? Yet, who would think of doing that?

Today, through modern scientific methods, permanent roofing material has been placed within the reach of the builder of even the smallest homes.

Concrete tile is available—ready to solve your roofing problem. Not only is tile and slate permanent and everlasting, but it is beautiful.

Slate, prepared by Father Time and Mother Nature for your use millions of years before you were born or thought of, is time's own provision for making things that last. He will not destroy his own handiwork. The soft, subdued tones of slate have for two hundred years or more lent grace and dignity to many a beautiful church or stately colonial mansion. Tile and slate will add greatly to the beauty of any home, regardless of type, and greatly enhance its value.—*East Bay Builder.*

ARCHITECTS URGED TO GIVE MORE ATTENTION TO KITCHEN PLANNING

While unquestionably it is worth while to try to educate the housewife to increase her efficiency, it would be still more effective to educate the architect and builder to an understanding of what is needed in an efficient kitchen for the housewife. In speaking before the National Housing Conference at Philadelphia, Pa., Miss Hildegard Kneeland, of the Bureau of Home Economics, United States Department of Agriculture, stressed this point particularly, after showing that the domestic kitchen still remains "our most important workshop."

"If the workshop is too large, if the equipment is inadequate, if the arrangement of equipment requires constant re-tracing of steps," she said, "no amount of process charting and organizing of work can offset the waste of time and energy involved. That most of the kitchens now in use reveal all these deficiencies needs no argument.

"The great majority of housewives must take their kitchens as they find them. For the fifty-four per cent who rent, remodeling is usually out of the question. And even for those who own their homes remodeling is costly and unsatisfactory. If we are to have scientific kitchens we must build them so in the first place.

"The job of educating the architects and builders is a much easier one than that of educating the housewives. Compared with twenty-six million housewives there are only ninety thousand builders and building contractors listed by the 1920 census. And of architects, a mere eighteen thousand."

Miss Kneeland outlined the features of the efficient and convenient kitchen that have been repeatedly brought out by the Bureau of Home Economics and discussed in bulletins on the subject.

"It is desirable," she said, "that all requirements for the 'scientific kitchen' be met by the builder—that he equip the kitchen completely with refrigerator, cabinet, serving and stacking surfaces, and all facilities for storage. For it is only through building in the equipment that it can be made fully efficient, as well as harmonious and attractive and easy to keep clean. And it is also only by building it in that its provision is assured. If the family must provide the missing units they will all too frequently be lacking, or when provided fit badly into the space allowed. Can we not come to accept the full equipping of the kitchen as part of the cost of housing, just as we now accept the built-in closets in place of the portable wardrobes and chests which used to disfigure our bedrooms? Let us urge the builder at least to plan for all the needed equipment, and to place his windows and doors, and the stove and sink which he does provide, in such a way that the housewife bent on efficiency in her kitchen does not meet insuperable obstacles."

Man and the giraffe are the only two living things that can't swim naturally. Throw a day-old kitten into the Mississippi and it will paddle its way to shore. The giraffe can't swim because he's not built that way. Man can't swim, just because he is afraid. The chances are that the reason you are not in the swim—financially or otherwise—is because you are afraid.—Glen Buck.

American
Fire and Marine
Insurance
Company"**

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

PHILADELPHIA

and the

write practically every form of Insurance, except life*

No Cold Weather Delays on this Job — thanks to "ANTI-HYDRO"

Much of the concrete and masonry work on this building was completed during the cold weather. "ANTI-HYDRO" was used in the concrete foundations and floors to insure quick setting and to prevent freezing.

"ANTI-HYDRO" lowers the freezing point of cement mixtures to 15 degrees F. Enables you to work practically all winter and finish on schedule time.

By avoiding shut-downs, you keep your organization together all winter and collect prompt payments for completed contracts.

"ANTI-HYDRO" also makes concrete and cement mortar permanently hard and waterproof in one operation. Prevents efflorescence stains coming from the mortar and saves time and money. It is easy to use. Mixes readily with water without the aid of skilled labor.

Twenty-five years of successful results make "ANTI-HYDRO" absolutely dependable. Satisfactory results are guaranteed.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

LIGHTNING SPEED WITH ABSOLUTE SAFETY

CROWE SAFETY SAW

The fastest and safest saw on the Market. Built of aluminum alloy, making it easy to carry. Standard saw blades. Wherever lumber is cut on the job, a Crowe Safety Saw will do the work in one-tenth the time.

Carpenters, contractors, concrete form workers, and shipping departments are enthusiastic about this saw—cutting time and cost. Easy to operate, and stands the gaff better than any saw of its kind known to the builder today.

If you are interested in saving costs in cutting lumber on the job, write today for interesting details.

"CROWE SAFETY SAW"
CUTS THE COST

Cuts sawing costs 75 to 90%.

Ball bearing throughout.

Gearing does not heat up.

General Electric Motor used.

Cutting line always in sight.

Crowe Safety Saws are patented.

The Crowe Safety Saw is officially approved for safety by industrial commissions, listed as standard by Underwriters' Laboratories, and recommended by insurance companies.

Cuts up to 6½ inches. Made in four sizes.

VALUE OF BUILDING PERMITS ISSUED IN PENNSYLVANIA CITIES AND BOROUGHs DURING JANUARY, 1929, IS NEARLY DOUBLE THE TOTAL OF JANUARY, 1928

Building permit reports received by the Department of Labor and Industry from 42 Pennsylvania cities and boroughs show the estimated cost of building construction, including additions, and alterations and repair work, to be \$21,489,905, for January, 1929. This amount compared to the \$11,107,237 total reported by these same cities and boroughs for January, 1928, shows an increase for January, 1929, of \$10,382,668, or 93.5 per cent.

Of the 42 cities and boroughs that submitted reports to the Department, 20 reported increases in amounts of construction work over January, 1928; 21 reported decreases; and one, Tyrone, reported no permits issued in January of either year. Of the 20 cities and boroughs that reported increases for January, 1929, two, which show increases in excess of \$500,000 each, are Philadelphia with \$12,678,770, or a 282.8 per cent increase, and Erie with \$523,405, or a 475.6 per cent increase. The city of Reading shows an increase of \$449,755, or 650.6 per cent. Fifteen other cities and boroughs that reported increases for January, 1929, and their respective amount and per cent of increase are as follows:

City or Borough	Amount of Increase	Per cent Increase
Allentown	\$50,050	90.4
Altoona	37,268	59.0
Bristol	1,050	700.0
Jeannette	3,680	593.5
McKeesport	4,855	5.5
Meadville	5,600	18.7
Monessen	795	14.7
Oil City	7,650	68.3
Pittsburgh	13,065	1.0
Scranton	56,441	56.2
Sunbury	1,700	340.0
Uniontown	29,225	166.1
Washington	2,520	35.1
Wilkes-Barre	39,316	40.0
York	51,283	103.9

Two other cities, Donora and Warren, also reported increases over last year. Donora reported a building total of \$65,000 for January, 1929, as compared with no permits in January, 1928, and Warren reported a total of \$46,965 for January, 1929, as compared with one permit for work costing \$185 issued during January, 1928.

The estimated cost of building construction in the city of Philadelphia for January, 1929, is nearly \$13,000,000, or 296.4 per cent, more than the combined building total for the other 41 cities and boroughs reporting for January, 1929. In January, 1928, the building total for Philadelphia was \$2,000,000, or 32.3 per cent less than the combined total for the other 41 cities and boroughs reporting.

Any pessimistic view as to a depression in building operations during 1929 must be dispelled by the increased building operations shown for the first month of the year, if these may be accepted as an indication of building activity for the remainder of the year.

Of the 21 cities and boroughs that reported decreases in estimated costs of building construction for January, 1929, from January last year, Harrisburg shows the largest decline with a reduction of \$2,600,660, or 82.5 per cent. This large decrease for Harrisburg is due to the inclusion in last year's total for January

of a permit for the construction of the new north office building on the Capitol grounds. With this permit excluded from Harrisburg's total for January, 1928, an increase of 259.3 per cent would be shown for January, 1929.

Four other cities reporting construction decreases in January, 1929, of more than \$100,000 each are Wilkesburg \$261,000, or 88.6 per cent; Bethlehem \$233,044, or 66.8 per cent; Pottsville \$145,850, or 96.7 per cent; and Johnstown \$139,490, or 96.6 per cent.

The borough of Berwick issued permits last January totaling \$1,325 and reported no permits issued during January of this year.

The remaining 15 cities and boroughs that reported decreases in building construction for January, 1929, and their amount and per cent of decrease are as follows:

City or Borough	Amount of Decrease	Per cent Decrease
Ambridge	\$31,950	77.1
Bradford	15,700	66.8
Butler	2,000	87.0
Carlisle	16,430	55.6
Clairton	13,312	61.7
Connellsville	24,000	90.6
Duquesne	5,865	20.5
Easton	12,320	37.3
Hazleton	2,683	10.4

Williamsport	44,776	44.8

Comparable building construction data as to types of buildings to be erected or remodeled is available for 40 of the 42 cities and boroughs. Figures for Harrisburg and Reading are excluded from this tabulation because the Department does not receive detailed reports from these cities.

The large general increase in construction shown for January, 1929, affected all groups. More new residential buildings of the one-family and two-family types are to be erected, but a lesser number of multi-family dwellings. The average cost of all new residential buildings for January, 1929, is \$8,068, or 14.5 per cent higher than for January, 1928. This increase in the average cost is due principally to the permits granted for the erection of 9 multi-family dwellings with an estimated cost of erection of over \$200,000 each. The total amount to be expended for the erection of new non-residential buildings in January, 1929, is \$10,372,000, or 304 per cent, more than for January last year. Churches, office buildings, and schools are three classes of new non-residential buildings where the amounts to be expended during January, 1929, are greatly in excess of those for January, 1928, but the class showing the largest increase is stores and other mercantile buildings where the amount is \$10,000,000 more than last year.

More extensive remodeling is indicated by the January, 1929, permits, since the average cost of remodeling per building is \$2,478 for January, 1929, as compared to \$1,333 for January, 1928. Permits for the installation of boilers, elevators, etc., also show nearly a \$300,000 increase over January, 1928.

INCREASED USE OF METAL LATH FOR 1928

The shipments of metal lath for 1928 showed an increase of 17.15% over the previous year. This reflects the tendency of modern builders and realtor operators to get away from the shoddy construction that was so common immediately after the war, and which in the course of less than a decade has proven not satisfactory nor stable enough to warrant the

investment of the American homebuilder's dollar.

Appreciation of fireproofing qualities of metal lath and a general tendency toward more fireproof construction is also an important part in this increase, but the greatest increase is attributed to the greater respect for plastering as a result of the Associated Metal Lath Manufacturers' campaign for "Better Plastering."

It is expected that the increase will be continued during the coming years as the Associated Metal Lath Manufacturers are about to embark in a more intensive promotion campaign.

Revolutionary changes in methods under which eight billion dollars annually is spent in the United States for construction operations were advocated by a convention of the Associated General Contractors of America held in Chicago last week. Affecting both public and private projects, these changes are being sought as a means of placing the construction industry "upon a more business-like basis," according to D. A. Garber, Washington, D. C., general manager of the sponsoring organization.

Mainly, the proposals are directed against unscrupulous and incapable builders whose operations saddle direct losses upon the building public through defaults and delays, the convention was told by Alan J. Parrish, Paris, Ill. "In addition," Mr. Parrish said, "these 'skin-deep contractors' upset the entire industry by forcing their way into competition with responsible builders. In short, the industry is loaded down with men who can't make money for themselves and prevent others from handling work on sound business principles."

In the field of private construction operations, the convention advanced a plan under which bankers, manufacturers and jobbers of construction equipment and materials, general contractors, bonding agencies, sub-contractors and other elements of the industry will cooperate to eliminate extension of false credits.

George B. Walbridge, Detroit, stated this plan already had been successfully operated in several large cities and outlined methods under which the system is to be made nation-wide in scope. "As matters stand," declared Mr. Walbridge, "it is almost possible for a green grocer with a few dollars in his pocket to put in a ridiculously low bid, secure the award and have all the construction equipment and materials he can think of placed in his hands."

"In other words, present chaotic conditions place men with little experience and virtually no ability to pay their bills in obviously unfair competition with men possessing responsibility and financial standing."

The campaign for improvement of affairs relating to highway and public works construction holds quite the same objective as the movement initiated to stabilize private building.

It is proposed that public officials determine the abilities and financial status of prospective bidders before receiving any offers. This is in contrast with the generally prevailing method under which qualifications are studied after the bids are made.

S. M. Williams, Washington, D. C., declared the adoption of the plan throughout the country would eliminate nine-tenths of the defaults and delays now experienced in handling highway and public works operations. He quoted federal highway officials as stating recent use of "pre-qualification" has encouraged competition by attracting bidders who previously refused to make offers rather than attempt to offer prices lower than those submitted by incapable or irresponsible persons.

H. S. Sisson, former State Highway Commissioner of New York, declared public savings would be gained and the construction industry would be stabilized if "the financial standing, business character and past records of bidders" were studied in advance by public officials.

HOME WITHOUT A CHIMNEY NOW A REALITY

The electrically-heated home, without chimney or coal bin, is now a reality. Homes and buildings in a half dozen cities are being successfully heated by this means this winter, Chester I. Hall, president of the Hall Electric Heating Company of Philadelphia, has stated. Mr. Hall developed this new method of heating while a research engineer of the General Electric Company, in charge of its experimental laboratory at Fort Wayne, Ind.

The method consists of heating large thermal storage tanks of water, using electric current only at night, when it can be obtained from the utility at the lowest cost, and releasing this stored heat within the home as required. The same plan, either in conjunction with the home-heating system or independently, can be used to supply the domestic hot water needs. The Hall heating system can be installed as a hot air, hot water, vapor or double-pipe system. The charging or storage of heat is substantially the same in all cases, the only difference being in the manner of discharging the heat.

"Electric heating is no longer experimental, and the cost is reasonable," says Mr. Hall. "This is the second winter in which the system has been used in Fort Wayne, and from data received from that city, as well as from other restricted territories in which the company is operating, I feel sure that it is firmly estab-

lished. I believe that the average eight-room home in the central belt of states, comprising Pennsylvania, Ohio, Indiana and Illinois, can be heated electrically for approximately \$350 per winter, provided, of course, the building is well insulated.

"Heat by electricity is not the product of combustion, and does not consume oxygen. The amount of oxygen in the air, ordinarily used to a great extent by coal, oil, gas or wood fires, is therefore left intact and the products of combustion, such as smoke, gases, soot and ashes, do not exist."

Instead of transporting household fuel, in many instances thousands of miles, heat or power is generated at the power station and conveyed to customers in the same way electric current is conveyed for lighting homes, heating ranges, cooling refrigerators, and operating other electric appliances.

"To the home owner, the safety factor is perhaps the most important," Mr. Hall pointed out. "As there is no combustion in the house; there is, consequently, no danger from fire. It is noiseless and all energy purchased is delivered into the house as heat. It is simply the release of stored heat controlled by a thermostat. From the housewife's viewpoint it reduces to a minimum the cleaning of drapes and the need of redecorating, for the customary ashes, smoke and soot are entirely eliminated. In addition there is also the absence of obnoxious and dangerous gases and odors, which often come from other methods of heating."

The mechanical features of the invention were developed by Mr. Hall in the laboratory of the General Electric Company in the past seven years. The idea was first submitted to a year's practical test in an average house before commercial installations were made in various localities. The first sample installation consisted of a water tank containing electric heating elements. From an insulated air space around the tank the radiated warm air was distributed by pressure to various parts of the home, as necessity demanded. Automatic timers turned on the electric current during the off-peak period of the power company, and when the water became heated to proper temperature the electric current was automatically turned off. With temperatures as low as five degrees below zero this home was kept comfortably warm.

"The general principle," says Mr. Hall, "is similar to that of the thermos bottle. In substance, heat is simply stored in a well-insulated large thermos bottle and is drawn off by the customer when he has need for it."

The Hall Electric Heating Company was formed a year ago. The General Electric Company, and associates, hold a substantial interest in the company and manufacture the control and electrical

parts. The engineering, development and sales work of the Hall Company are carried on at its main office in Philadelphia.

WOMEN INVEST HEAVILY IN HOME VENTILATION

Sale of Exhaust Fans Play Important Part in Electrical Industry

Electrical ventilation of the home is coming into its own. The figures prove it.

In its annual report of the industry, a nationally known electrical magazine says that 1,223,000 homes in the United States are equipped with electric refrigerators, or 6.4 per cent of the total number wired for electricity.

But the same report directs attention to the fact that 29.5 per cent are supplied with electric fans of which a large proportion are ventilating fans used for exhausting vitiated air and odors out of kitchens, damp basements and hot attics. American housewives are investing more liberally in the maintenance of healthful conditions and comforts in the home through electrical control of air conditions, these statisticians have learned. The woman in the home has found that it is more economical to use a fan to drive greases and odors out of the kitchen than to allow them to drift back into other rooms of the house and to settle on draperies, curtains and furniture.

Of the 19,012,664 wired homes in this country, the survey shows that 93 per cent are equipped with electric irons, 40.7 per cent with cleaners, 30.2 per cent with washing machines, 28 per cent with toasters, 15.7 per cent with heaters, 6.4 per cent with electric ranges, and 2.5 per cent with ironing machines. Sale of electrical appliances increased greatly during 1928, the report says.

Distribution of electric ranges for the year is placed at 135,000 units, valued at \$22,175,000, compared with 110,000 in 1927 valued at \$17,600,000. Sales of electric domestic refrigerators in 1928 amounted to 468,000 units, valued at \$128,700,000 against 365,000 units valued at \$82,125,000 in the preceding year.

The number of clothes washing machines sold in 1928 was 817,107 against 775,661 the year before. Sales of irons last year totalled 3,000,000 while cleaners sold amounted to 1,200,340 valued at \$66,018,700. The big item in the national electric bill, of course, is incandescent lamps, which involved \$125,000,000 last year. Fans sold were valued at \$14,698,812.

SQUASH RACQUETS SWEEP AMERICAN ATHLETIC CLUBS

Toledo Club Installs Four Courts With Special Air Conditioning System

Like many other up-to-date athletic clubs in the larger American cities, the Toledo Club has yielded to the sweeping popularity of squash racquets and has built four courts in the basement of its building where it will be possible to play the game at any season of the year regardless of summer heat or winter chills.

William K. McColl, athletic director of the club, announces that ideal weather conditions for squash racquets are manufactured by artificial means to provide players with ample ventilation or air change. In many clubs, the courts are located on the roof or near the top of the building in order that plenty of fresh air may be obtained. In the new courts of the Toledo Club, however, air is pumped in by means of powerful ventilating fans which take the air through a filter and heating or cooling coils, according to the season, and effect a change in the air of each court every five minutes.

As great as has been the growth of squash tennis, it is frequently said around the clubs that the game is losing ground before the advance of squash racquets, according to McColl. This latter game had first been highly favored among the university graduates and has much in common with squash tennis. Like the latter game, it is played in a four-wall court with a racquet and ball. The racquet, however, is different in shape, possessing a small round head and a longer handle than the squash tennis bat. The ball is entirely different from and

lacks the liveliness of the squash tennis ball.

It is generally agreed that in squash racquets the strain upon the player is greater than in squash tennis. The best players in squash racquets are considerably younger than the champions in squash tennis.

Nevertheless, squash racquets has as great an attraction for the "old grad" as has squash tennis, and it has been gaining a stronghold in New York, Boston, Buffalo, Cleveland, Detroit, Chicago, Milwaukee and many other cities as far west as San Francisco. Whereas squash tennis is confined almost entirely to New York—there are a few centers in the middle west—squash racquets has something like a national following.

Like squash tennis and squash racquets, court tennis and racquets are played with a ball and a racquet, but there the similarity pretty nearly ends. Racquets is a game of terrific hitting, played on a slate court where only the hardest can survive. The swish of the long handled racquet, the crack of the ball against the slate walls, the cry of the marker, "Play" after every stroke and the cyclonic action going on in the court all make for an exciting hour.

Court tennis is a complicated game that remains unintelligible to the spectator even after he has watched it for years. Only the man who plays the game can hope to have a thorough understanding of its fine points. It is more like lawn tennis than any other game, for a net divides the court and the scoring is similar to the system used in lawn tennis. But the "railroad" service, the penthouse, the dedans, the tambour, the grille, the various "galleries" and the chases make it mystifying to the novice.

A GOLD STRIKE FOR DEALERS

The General Fuel Dealer Has Great Advantages Over Those Handling Only Coal and Wood.

BY FRANK E. FISKE

The rapidity with which the oil heating industry has grown and developed in

America within the past two years has brought coal and other fuel dealers face to face with a problem of great importance, not only to them, but to the oil heating industry as well. And the problem is this:

Should the coal dealer consider the new oil heating process as a competitor and fight its constantly growing popularity? Or, —

Should the coal dealer accept this new arrival as an additional part of his business, and capitalize on its possibilities?

After all, one group argued, the average coal dealer was not necessarily a merchant for any one particular kind of fuel, but rather a dealer in all fuel. Therefore, why should he not give his customer the benefit of the same kind of efficient service on fuel oil as had been given on coal, wood, coke or anything else included in his line of wares.

There existed also, however, another group of coal men who were not enthusiastic about installing the equipment necessary to take care of this new development. Oil seemed to them to be a stepchild which was being forced upon them by a lot of unpopular relatives—in this case, the oil men.

For a while the controversy raged within the coal business, with both sides scoring many points, but with neither side conceding victory to the other.

The result was that some of them added oil to their list, while others continued on the old scale. But progress seldom permits obstacles to stand in its way for very long.

As oil burners were improved, the use of this new mode of heating rapidly gained popularity. Particularly was this true in the large apartment buildings, office buildings and other places where an automatically controlled temperature proved essential to the health and general comfort of many thousands of people. The demand for oil burners among individual home owners was slower to materialize, but nevertheless just as damaging to the coal dealer when it did arrive.

The coal dealers who realized the possibilities in the sale of fuel oil saw their volume of business continue and grow. When customers of years standing abandoned the older methods of heating and took on the new way, these dealers were in the position of being able to furnish them with the same kind of satisfactory service they had been accustomed to. As a matter of fact, these dealers found that the delivery of fuel oil offered greater possibilities for efficiency, and, therefore, greater financial returns than some of the other fuels they were handling.

But still, a large number of coal dealers remained adamant and continued to fight oil rather than adopt it.

In the final analysis, there seems to be

no practical reason why a coal dealer should not become a fuel dealer. When the automobile graduated from a pleasure vehicle to a necessity, the old-time buggy builder who was on his toes abandoned the old for the new, and began to build automobile bodies. The best testimonial to the wisdom of this movement is the millions which have been made and are being made in this line of endeavor.

Brewster & Locke, of New York; Durham, of Philadelphia; Judkins, of Merrimac, Massachusetts; and probably most notable of all, General Motors, are all companies which graduated from the buggy-building stage to what they are today.

It might be interesting to recall that in 1903 what is now General Motors was known as The Durant-Dort Carriage Works, and later The Flint Wagon Works. W. C. Durant was its president, at a salary of twenty-five dollars per week.

The same situation applies to every other new product that a fickle yet progressive public demands.

There is the example of the radio, electric refrigerator, the washing machine and countless others. And in nearly every case, the dealer in products which preceded these new innovations adjusted his business to meet the new demands made upon it. That is, the successful ones did.

According to figures compiled by the Oil Heating Institute, 422,700 oil burners were in domestic use in the United States on January 1, 1929. This figure covers the number of oil burners in operation in private homes and small apartment houses. Based on figures compiled by the United States Bureau of Mines in its national survey of fuel oil distribution, in co-operation with the American Petroleum Institute, it is estimated that 988,596,000 gallons of oil will be consumed in 1929 by oil burners for domestic use. On January 1, 1929, 33,500 oil burner installations were in operation for commercial heating, i. e., in large apartment buildings, office buildings, theatres, schools and similar structures. It is estimated that 777,000,000 gallons of oil will be used for this commercial heating. Of all the oil consumed in the United States in 1928 it is estimated by the Oil Heating Institute, that 9.90% was used on oil heaters. Of this amount, 4.99% was used for domestic heating, and 4.91% for commercial heating.

This means, of course, that someone must deliver to these customers a sufficient quality of fuel oil to keep these heaters in operation. Close to a half-million potential customers for the coal dealer who sees fit to modernize his business.

At the rate that oil heaters are being demanded it will not be long before this demand is doubled and trebled.

Health authorities have concluded that an even temperature in the home, office, theatre, etc., is far more conducive to good health than the uneven temperatures which the old style coal furnace was responsible for. Everywhere they are urging automatic control of heat in the interest of avoiding and preventing respiratory diseases, such as influenza, pneumonia, colds and others.

On the other hand, city officials and health experts have been devoting considerable time to the devising of ways and means of eliminating or abating, if possible, the so-called smoke nuisance. In connection with these studies, it has been found exceedingly difficult to do away with those great clouds of smoke that seem to envelop most cities, regardless of what kind of coal is used and regardless of the degree of care practiced in the utilization of that fuel.

The answer lies in the findings of the hundreds of apartment house and theatre owners who have contributed their share toward abatement of the smoke nuisance by installing oil burners.

Add to these favorable circumstances the fact that architects and builders who are leaders in their respective lines of endeavor have found that the installation of oil burners eliminates the necessity of building a cellar on the average private home, thereby reducing the cost of that establishment, and you arrive at the conclusion that the oil burner is not only an established proposition, but one that has become a necessity to a degree far more important than is at first apparent.

The coal dealer who is wide awake to his possibilities knows what tremendous progress has been made in the development of the fuel oil business. He knows that distribution problem has been given much time and study. He knows what the situation is in his local community. If he does not know, very little research work, will put him in touch with the answers to these questions.

The business of selling oil can be made just as profitable as the business of selling coal, or any other product, or commodity, for that matter. Success in the sale of anything depends on the business acumen of the dealer and his methods of doing business.

Heating with oil has long since passed from the experimental stage. It is an established national practice, and one that is constantly growing.

And the coal dealer who continues to neglect the opportunity afforded him through the oil burner is placing himself in exactly the same position as the horse trader who says the automobile or the radio is just a passing fad.

Many a man would do a better job if he didn't know about putty.—Ex.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

No Cold Weather Delays on this Job — thanks to "ANTI-HYDRO"

HENDRICK HUDSON GARAGE
TROY, N. Y.

G. S. THOMPSON & Co., Inc. : ARCHT.
CHAS. F. CROWLEY Co., Inc. : CONTR.

Much of the concrete and masonry work on this building was completed during the cold weather. "ANTI-HYDRO" was used in the concrete foundations and floors to insure quick setting and to prevent freezing.

"ANTI-HYDRO" lowers the freezing point of cement mixtures to 15 degrees F. Enables you to work practically all winter and finish on schedule time.

By avoiding shut-downs, you keep your organization together all winter and collect prompt payments for completed contracts.

"ANTI-HYDRO" also makes concrete and cement mortar permanently hard and waterproof in one operation. Prevents efflorescence stains coming from the mortar and saves time and money. It is easy to use. Mixes readily with water without the aid of skilled labor.

Twenty-five years of successful results make "ANTI-HYDRO" absolutely dependable. Satisfactory results are guaranteed.

"THE YARD WITH THE STOCK"

Building for Endurance

Construction projects fall into two general
classes, the first comprising buildings that in
but a few years will be torn down and replaced
by more modern ones.

The second class includes subways, large
bridges, monumental buildings occupied by the
OWNERS, etc., all built to last for many
generations.

It is significant that most of our work has
been on jobs in the latter class.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

Parochial School, Cambridge road and Virginia avenue, Westmont, N. J. Architect taking bids due March 25th. Architect, Emil G. Perrot, 1211 Arch street, Philadelphia. Owners, Holy Saviour Roman Catholic Church, Rev. Lewis A. Hayes, Westmont, N. J. Brick, granite, steel, 2 stories and basement, 157x48 feet, excavation, reinforced concrete work, bond, floor hardener, waterproofing (Parklock), dampproofing (Hydroseal), cast stone alternate, caulking (Ev-Air-Tight Co.), cinder block, steel base joist construction, iron work, metal stairs, roof ventilators (Globe), built-up roof, pine floors, Austral windows, weather stripping (Chamberlain), kalamein doors, tin-clad doors, hollow metal partitions (Sanymetal Products Co.), metal lath, plastering, marble and tile work, mastie floors (Duraflex-Rezilite), plumbing, electric work.

Church and Sunday School, Northeast Corner Twenty-sixth and Hayes streets, Camden, N. J. Owners taking bids due March 25th. Architect, Edwin A. Early, 1511 Arch street,

Philadelphia. Owners, Christ Lutheran Church, Twenty-sixth and Hayes, Camden. Stone, cast stone, steel, 1½ stories and basement, 100x40 feet, slate roof, pine and cement floors, plumbing, steam heat, electric light, metal lath, tile work.

Locker and Recreation Building, Gloucester City, N. J. Owners taking bids due March 21st, 8 P. M. Architects, Lackey & Hettle, 5 Hudson avenue, Camden, N. J. Owners, Camden County Park Commission, Camden, N. J. Cinder block, stucco, 2 stories, 100x57 feet, Barrett specification roof, cement floors, metal partitions, lockers, stools, electric light, residence steel sash.

Apartments (20) and Garages, Westmont, N. J. Architect, J. Ethan Fieldstein, Otis Building, Philadelphia. Owner, name withheld. Brick, 2 stories, 20x60 feet, slag roof, hardwood floors, vapor heat, tile work, rolled steel sash. Plans completed. Architect ready for sub-bids.

Residences (12), \$3,000 each. 15 to 37 South Thirty-eighth street, Camden, N. J. Permit issued. Owner, Ervin Fister, Maple Shade, N. J. Brick, block, 2 stories, 18x32 feet, slag roof, hot water heat.

Residences (5), \$2,800 each. 1750-58 South Ninth street, Camden, N. J. Permit issued. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owner, Russell H. Bennett, Marlton, N. J. Brick, 2 stories, 18x30 feet, slag roof, hot air heating.

High School, Glassboro, N. J. Low bidders. Architects, Ritter & Shay, Packard Building, Philadelphia. Owners, Board of Education, Dr. M. J. Luffbary, Glassboro, N. J. Reinforced concrete, 3 stories and basement, 163x53 feet, 2 wings, 138x55 feet. General, Pasquale & Schaible, Vineland, N. J. Electric, Walter L. Lyle, Brookline, N. J. Heating, Burns, Lane & Richardson, Trenton, N. J. Plumbing, A. H. Knoetner & Son, Audubon, N. J.

Bank (alts.), State street, Trenton, N. J. Architects, W. W. Slack & Son, Trenton Trust Building, Trenton, N. J. Owners, Trenton Trust Co., care of architects. Brick work, bronze sash, terrazzo work, ornamental iron grills. Contract awarded E. D. La Rue, 53 South Hermitage avenue, Trenton, N. J.

Road Work, New Jersey. Route 3, Section 2, Paterson Plank Road Relocation, Bergen and Hudson Counties, awarded to Harper Brothers, Hackensack, N. J., \$551,000.

Route 44, Sec. 3 and 4, Bridgeport and Nortonville Causeways, in Gloucester and Salem Counties, awarded to Perkins Construc-

Road Work, New Jersey. Owners taking bids due April 1st, at noon. Owners, State Highway Commission. A. Lee Grover, Chief Clerk, Broad Street Bank Building, Trenton, N. J. Route S-41, Sec. 1, Kings Highway to Marlton, Burlington Co. Unclassified excavation, reinforced pavement, gravel surface. Route 39, Sec. 2, widening of Route 39, Sec. 2, Bordentown to Chambers Corners, Burlington Co. Unclassified excavation, reinforced concrete pavement, surface type FA-BC-1, improved shoulders. Certified check, 10%. Deposit, \$10.00

New Jersey Contracts Awarded

Plant, Camden, N. J. Contract awarded Barclay White Co., 22 North Thirty-sixth street, Philadelphia. Engineers, R. A. Wickland & Co., Inc., 205 West Wacker Drive, Chicago, Ill. Owners, Rundle Manufacturing Co., care of Mr. A. C. Held, Twenty-eighth and Cleveland streets, Milwaukee, Wis. Bond, excavation, reinforced concrete work, cement floors (Master Builders), floor hardener, fire doors, ornamental iron work, steel sash (Federal or equal), built-up asphalt (Barber or equal), metal lath, plastering, Zerno-lite (American Cement Paint Co.) (plumbing, heating, electric and elevators separate bids). Shipping building, 2 stories, 121x182 feet. Enameling building, 1 story, 18x78 feet. Cleaning building, 1 story, 102x140 feet. Mill and locker building, 3 stories, 68x69 feet. Power house, 1 story, 88x59 feet. Foundry, 323x150 feet, 1 story building.

Residence, Moorestown, N. J. Contract awarded M. C. Pennell, Merchantville, N. J. Architect, Stanley P. Stewart, Land Title Building, Philadelphia. Engineer, W. Macy Stanton, Land Title Building, Philadelphia. Owner, name withheld.

Store and Residence, 1100-02 South Third street, Camden, N. J. Contract awarded Salvador Sylvester, 431 Stevens street, Camden, N. J. Architect, F. V. Gaudelli, Audubon, N. J. Owners, Italian Greek Importing Co., care of architect. Brick, 2 stories, 30x66 feet, 1 story, 10x30 feet, slag roof, hardwood and cement floors, electric light, metal ceilings, waterproofing, concrete work.

Service Station, Camden, N. J. Contract awarded George H. Anderson, 401 Franklin avenue, Collingswood, N. J. Architect, private plans. Owner, Israel Schatz, 213 Federal street, Camden, N. J. Block, 1 story, 19x100 feet, slag roof, cement floors.

Bakery Building (add.), 411½ Walnut street, Camden, N. J. Contract awarded Frank Valeriani, 259 Spruce street, Camden, N. J. Architect, private plans. Owner, John Marina, 413 Walnut street, Camden, N. J. Block, 1 story add., 21x65 feet, slag roof, steam heat, electric work.

Building, 912 Line street, Camden, N. J. Architect, private plans. Owner, James Lamont, 912 Line street, Camden, N. J. Contract awarded Michael De Mosi, 3318 Mitchell street, Camden, N. J. Brick, 1 story, 29x129 feet, slag roof, electric light.

Building, Atlantic City, N. J. Architect, Israel Demchick, 1701 Chestnut street, Philadelphia. Owners, Linton's Lunch, Watts and Wallace streets, Philadelphia. Brick, steel,

limestone, 3 stories, 140x30 feet (kitchen equipment reserved), slag roof, concrete floors, tile and marble work, brass pipe. Contract awarded Hiram Mathias, Atlantic City, N. J.

Hangars (6), Crescent Boulevard, Camden, N. J. Owners, Central Airport, Inc., C. Townsend Ludington, chairman, 1620 Mitten Building, Philadelphia. Steel, brick, 200x120 feet. Contract awarded Airport Development & Construction Co., 1620 Mitten Building, Philadelphia, who will start work immediately on first hangar.

Miscellaneous Construction News

Garage, location withheld. Architect will take bids next week. Architect, C. R. Hope, DuPont Building, Wilmington, Del. Owner, name withheld. Fireproof, 2 stories, 54x120 feet, slate roof, cement floors, electric light, tile, steel sash, skylights, hollow metal doors.

The Gansevoort Inn, East Park, West Court street, Steuben street, Rome, N. Y. Owners taking bids due March 27th at noon. Architects, Hart & Shape, 247 Park avenue, New York City. Owners, Rome Community Hotel Corporation, care of A. W. Hooke, secretary, care of Oneida County Saving Bank, Rome, N. Y. Brick, steel, concrete, 4 stories and basement, 95x160 feet, bond, excavation, reinforced concrete work, integral waterproofing (Master Builders, Permontite, Truscon or equal), cement floors, floor hardener (L. Sonneborn's, Master Builders or equal), caulking, hollow tile, cast stone, tile and marble work, composition floors, asbestos shingle roof (Mowhawk Asbestos Co.), slate roof, metal lath, plastering, ornamental plaster, kalamein doors, frame and trim, ornamental iron work, iron stairs, coal chutes, iron gratings (Irving), metal toilet stalls (Veneer Steel or equal), dumb waiter (Sedgwick Machinery Co.), elevators (Otis or Gurney), hardware (allowance \$7,000), oak floors, metal weather stripping (Anchor Weather Strip Co. or equal), mail chute, screens. Owners taking separate bids on plumbing, heating, ventilation, refrigeration, kitchen equipment, electric refrigerators. Certified check, 5 per cent. of bid.

Church, Washington, D. C. Owners taking bids due March 30th. Architects, Ritcher & Eiler, 147 North Fifth street, Reading, Pa. Owners, Lutheran Church of the Atonement, H. P. Cremerer, 943 L street, N. W., Washington, D. C. Steel, brick, stone, 1 story and basement, 60x115 feet, built-up slate roof, composition floors, hollow tile, safety treads, waterproofing and dampproofing, wire work, cast stone, hollow metal doors, steel sash, metal lath.

Charles Carroll School, Westminster, Md. Owners taking bids. Architect, B. E. Starr, 9 North Second street, Harrisburg, Pa. Owners, Carroll County School Board, Mr. Unger, Westminster, Md. Brick, steel, 2 stories, 180x150 feet, composition roof, maple floors, bond, rolled steel sash (heating, plumbing and electric separate).

Apartment House. Architect, W. E. Hance, Equitable Building, Wilmington, Del. Owner, name withheld. Location, Tenth and Jefferson street, Wilmington, Del. Architect taking revised bids due March 28th. Brick, cast stone, architectural terra cotta, steel, 10 stories, 40x119 feet, slag roof, oak and pine floors, steam heat, electric work, metal lath, tile, marble, steel sash, ornamental iron, bond.

Apartment House, Wilmington, Del. Architect taking bids due March 28th. Architect,

W. E. Hance, Equitable Building, Wilmington, Del. Owners, Twebe Delaware Company, J. F. Dunning, president, Rulstian avenue, Wilmington, Del. Reinforced concrete, brick, limestone, 8 stories, 72x96 feet, tile and plastic roof, hardwood floors, hollow tile, elevators, roof ventilators, waterproofing and dampproofing, steel stacks, incinerators, bronze, ornamental iron, bond, fire doors, steel sash, tile, marble, metal lath, vapor heat, oil burner, electric light.

Residence, Brookville, Long Island, N. Y. Architect, Horace Trumbauer, Land Title Building, Philadelphia. Owner, James B. Clews, 9 Broadway, New York. Limestone, fireproof, 2½ stories, 174x100 feet, slate roof (hardware reserved), vacuum heat, hardwood and cement floors, tile and marble work, 15 bath rooms, dumb waiters, ornamental iron work, brass pipe, cast stone, bluestone. Architect taking bids due March 21st.

Road Work, Delaware. Owners, State Highway Department, Dover, Del.

Contract 115, Milford towards Cedar Neck School, 1.22 miles. Low bidder, W. W. Truitt, Lincoln City, Del., \$33,199.50.

Contract 116, Newport Gap Turnpike, 2.00 miles. Low bidders, D. E. O'Donnell & Sons, Ridley Park, Pa., metallic joint, \$57,705; non-metallic, \$48,180.

Contract 117, Milton, Ellendale, 6.01 miles. Low bidders, Highway Engineering & Construction Co., Selbyville, Del., metallic, \$138,703.50; non-metallic, \$136,798.50.

Miscellaneous Contracts Awarded

Freight Car Shops and Power House, Russell, Kentucky. Architect, private plans. Owners, Chesapeake & Ohio Railway Company, Richmond, Va. Brick, steel, concrete, corrugated metal, 1 story, 750x239 feet 5 inches, built-up roof, cement, tile roof, linoleum floors, safety treads, roof ventilators, rolled steel sash, electric light, iron stairs, metal partitions, gypsum tile work. Contract awarded Hughes-Foulkrod Co., 1505 Race street, Philadelphia.

Residence (alts. and add.), 2003 Parkway, Wilmington, Del. Contract awarded C. J. Dougherty, 600 Tatnall street, Wilmington, Del. Architect, E. C. May, DuPont Building, Wilmington, Del. Owner, G. R. Kaiser, on premises. Brick or tile and stucco, 1 story, built-up roof, electric light, tile work, flagstone.

Residence (alts. and add.), 2310 West Seventeenth street, Wilmington, Del. Contract awarded H. S. Lynch Co., 715 Tatnall street, Wilmington, Del. Architect, E. C. May, DuPont Building, Wilmington, Del. Owner, E. G. Ackart, on premises. Brick, second story add., 20x14 feet, built-up roof, hardwood floors, heating extension, electric light, tile work.

ESTIMATOR WANTED for builder's office. Opportunity for man with initiative, experience, local acquaintance. Write for interview, giving full details. Box A, Builders' Guide, Perry Building, Philadelphia.

ESTIMATOR-SALESMAN wants position with reliable sub-contractor or material company; wide experience and acquaintance with Philadelphia builders and architects. Box B, Builders' Guide, Perry Building, Philadelphia.

AIRPORT DEVELOPMENT STIMULATES INDUSTRY

Economic Significance of Lehigh Airports Competition Shown in Variety of Problems Involved

Airport development—the latest offspring of aeronautical activity—has suddenly taken its place as the most important problem in the growth of commercial air transportation. It has already become apparent that air traffic can now grow no faster than the extension of adequate ground facilities in the form of airports and emergency landing fields. At the same time, airport development has begun to exert a powerful influence in many fields of business activity with which it is not normally associated in the public mind. It has given particular stimulus to the building field.

Colonel Harry H. Blee of the Airports and Airways Section of the Department of Commerce, made the statement early in February that about 1,000 airports were in various stages of actual development throughout the United States and that approximately 1,000 other airports were under consideration by communities, air transport companies, and other interested organizations. He commented upon the fact that these figures were merely estimates because they were changing so rapidly they could not be checked from day to day. Four months ago not over 400 airports were actually under way. It is also estimated that about three hundred millions of dollars will be spent during the next twelve months for the construction and development of airports, but this figure likewise is a mere guess. For 25 years people have been thinking about flying and flying machines. In that period they have become air-minded to a considerable extent. Within the last five years—or it may be said within the last year—public attention has been drawn to the commercial aspects of flying and to the need for airport facilities. People are now becoming “airport-minded.”

It is amazing to realize the ramifications of influence which aeronautics is exerting upon the nation's business and the nation's prosperity. The hobby of the two bicycle makers of Dayton and Kitty Hawk has in 25 years begun to transform the business methods and transportation systems of the world. Unfortunately, the progress of aeronautics has been so rapid that the public has not been able to keep pace with its values and developments. Of the few hundred landing fields in this country, there is not one which provides the facilities necessary to encourage passenger transportation. There is not one which can grow to meet the demands of increase in air traffic without wasting some part of the money already invested. It has been impossible to

be sufficiently far-sighted in airport planning, because there has been no successful precedent to guide us in our work. In Europe, the well established airports are revamping their layouts; Croydon has scrapped a six hundred thousand dollar investment and is spending over a million dollars to correct deficiencies in the earlier arrangement and equipment of the port and to provide facilities which it is hoped will meet the requirements for several years into the future. Airport development is in its infancy throughout the world, and while Europe has so far made the greatest advances in this field, America, unhampered by precedent, can be expected to outstrip Europe within the next few years in airport design and construction and in the growth of its commercial traffic.

Three hundred million dollars will probably be spent in the next twelve months for airport construction without the guidance of any sound experience. Much of this money may be wasted because communities cannot foresee how best to plan their ports and the facilities which air transportation requires. Appreciating the potential loss which this situation creates, the Lehigh Portland Cement Company has made a timely gesture of tremendous significance to the nation as a whole, and to the aviation industry in particular, by establishing a national competition among architects and engineers for the design of airports.

It may seem absurd that a simple competition among people who are not necessarily flyers and who heretofore have not been directly concerned with the creation of flying facilities should be of great significance, but upon second thought, it will become apparent that through crystallizing the attention of thousands of designers on airport problems, many of the diverse ideas which are now guiding airport activities will be tested out and the good wheat separated from the chaff. Furthermore, it is quite possible that such a competition will bring out new solutions of the airport problem.

The Lehigh Airports Competition is a serious endeavor to contribute something of practical value as a guide for the expenditure of the billion or more dollars which inevitably will be spent within a few years for ground facilities in conjunction with commercial aeronautics. The competition program was formulated by a Program Committee of nationally known experts, headed by Harvey Wiley Corbett, one of the country's foremost architects. The Program Committee consisted of four sections of Architecture, Engineering, City Planning, and Aeronautics. With Mr. Corbett on the Architectural Section are Raymond Hood, co-designer of the Chicago Tribune Tower, the American Radiator Buildings in New

York and London; and other world famous structures; Professor William A. Boring, Dean of the School of Architecture, Columbia University; Francis Keally, professional advisor for the competition and an architect who spent last summer flying through Europe making a special study of airports; and Parker Morse Hooper, Editor of *The Architectural Forum*. Professor Boring, incidentally, is planning to spend the summer holidays in Europe and will make a special study of airport development in order to bring the latest European thought to bear upon the judgment of the competition entries at the close of the contest.

The Engineering Section, headed by Morris Knowles, noted civil engineer and city planning expert and including Francis Lee Stuart, former Vice-President of the A. S. C. E., Gavin Hadden, C. E., Harold M. Lewis of the Regional Plan of New York and its environs, and Colonel Willard Chevalier, Managing Director of *Engineering News-Record*, are guiding the policies of the competition with respect to the engineering problems which are such an important phase of airport development.

Mr. George B. Ford, City Planner, is Chairman of the Civics and City Planning Section, in which work he has been assisted by Mr. E. P. Goodrich, who is now in China making a study of engineering problems, including the development of airports in conjunction with the expansion of Chinese transportation systems. Mr. Fred C. McLaughlin, Mayor of White Plains, New York, President of the New York State Conference of Mayors and of the Westchester County Planning Federation, represents the interests of municipal authorities in the competition, and Harold Bittenheim, Editor of *American City*, represents city engineers, Chambers of Commerce, and similar bodies concerned with this problem.

The Aeronautics Section of the Program Committee is headed by Dr. George W. Lewis, Chairman, Director of Research of the National Advisory Counsel for Aeronautics, and includes such experts as Colonel Harry H. Blee of the Department of Commerce; Porter Adams, Executive Secretary and past President of the National Aeronautic Association; Major John Berry, Manager of the Cleveland Municipal Airport; L. K. Bell, Secretary of the Aeronautical Chamber of Commerce; Colonel Paul Henderson, Vice-President of the Transcontinental Air Transport and former Asst. Postmaster-General in charge of Air Mail Service; Charles S. (Casey) Jones, President of the Curtiss Flying Service; Ernest Jones, Aeronautics Expert of the Department of Commerce; and Harry Schwarzschild, Editor of *Airports*. These men and their other associates on the Program

Committee were faced with a task of no small importance in determining what limitations and what requirements should be incorporated in the competition program to create a group of designs which should be of practical as well as inspirational value to municipalities and air transport companies interested in the development of modern airports. The very difficulties they encountered give evidence of the varied nature of the airport problem and of the many types of business upon which airport development impinges.

Naturally, the modern airport must resemble to a considerable extent a well-equipped railroad terminal. It must provide a passenger station with ticket offices, baggage rooms, waiting rooms, public restaurant, toilets, and other commonplace facilities. Without doubt, it should provide an immigration and customs office, a postoffice, and adequate facilities for handling express and mail. There must be administration offices, not only for the various aerial transport lines which utilize the field, but for the control of flying operations at and adjacent to the port. There must be quarters for the field and flying personnel, and probably a hotel for transients as well as these permanent guests. There must be hangars for the care of planes, machine shop, fire station, gasoline and oil filling stations, an extensive and elaborate lighting system, and many other service facilities required for the care and operation of planes.

The more important features, however, which the competition has developed is the necessity for developing other uses and other activities in conjunction with the airport. At Croyden Field in England, at the Tempelhof Field in Berlin, and at the Littorio Airport at Rome, and other European airports, thousands of visitors come to the field daily or during weekends to watch planes arrive and depart. These people come in a holiday mood and they patronize the beer gardens, restaurants, and amusement concessions which rapidly sprang up to fill their needs. The modern airport must expect to derive part of its income from concessions of this type; a feature which is by no means impracticable, because there is always the need for marginal strips around the borders of flying fields which will be free from tall buildings in order to permit planes to glide gently toward the landing area. These marginal strips can be logically utilized as park areas, outdoor restaurants, recreational and athletic grounds, and as parking space for automobiles. They may be very beautifully developed as part of a city's park and recreation system, giving to the airport an attractive appearance from loft as well as from the ground.

What does all this mean to the practical business man? Obviously, the

building industry itself is being stimulated by a new market for its materials. An airport construction program involves practically every type of material used in modern buildings. It involves extensive grading and drainage work, the laying of huge areas of pavement, the erection of miles of protective fences, the laying of more miles of underground electric conduit for lighting purposes, the planting and decoration of marginal strips, the construction of new roads for access to the heart of the community it serves, and often the development of new local transportation systems, including subways, bus lines, and railroad connections. If the airport is adjacent to water, other facilities are necessary for correlated shipping interests. This three hundred million dollar market (assuming the estimate to be well founded) for building materials is but one result of airport activity.

A part of the total expenditure goes into other types of business, much of it locally to the merchants of the municipality. After the airport is completed, it attracts other types of construction, including the development of airplane factories and associated manufacturing interests. It has already been discovered that the modern airport stimulates real estate values for residential as well as business purposes. It can be truly said that commercial aviation has brought new business opportunities literally on its wings to almost every field of commercial endeavor.

The Lehigh Airports Competition, which will crystallize the thoughts of the nation's planning experts, will close in November, 1929. Prizes amounting to \$10,000 have been posted by the Lehigh Portland Cement Company to be distributed for the winning designs. Subsequently, it is intended that this material shall be published for the benefit of municipal and aviation interests. It is quite probable that the winners will also receive commissions as a direct result of this competition, for the development of actual airports.

AUTOMATIC HEAT REGULATOR WILL HALT OVERHEATING

Experiments by noted public health authorities have confirmed the conclusion that we catch cold chiefly because we live in a dry, overheated atmosphere during the winter months. These authorities say that overheating weakens the tissues of the nose and throat, so they cannot stand the shock of sudden temperature change when we leave a heated room and go outdoors.

Certain it is that in many homes the start of the heating season means one cold after another. Summer bloom leaves the cheeks of the children, and the entire family seems to slow up. It is not too

much cold outdoors, but too much heat in the home that causes the trouble.

Oveheating may be prevented if the home heating plant is equipped with an automatic heat regulator. This device maintains a steady, even temperature without the need for any one touching dampers or drafts.

A clock arrangement rouses the fire early in the morning so that rooms are warmed when it is time to dress. The heat regulator almost always brings fuel savings that within a short time pay for it. Like many other permanent improvements for the home, this equipment may be purchased on a budget plan.

—East Bay Builder.

Arthur B. Murphy, formerly Secretary-Manager of The Common Brick Manufacturers' Association, Philadelphia District, and more recently associated with The Independent Brick Company of Trenton, N. J., has assumed his new duties as Secretary and Treasurer of The Covell Corporation, to which offices he was elected on February 11th.

Mr. Murphy is now located at 1600 Walnut Street, Philadelphia, the main office of The Covell Corporation, which owns and controls basic patents on building units and systems known as the "Weldcrete" method of masonry construction.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soil with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

Advertising is telling who you are, where you are, and what you have to offer the world in the way of service or commodity.

If nobody knows who you are, or what you have to offer, you do no business, and the world is the loser through giving you absent treatment.

Life is too short for the consumer to employ detectives to ferret out merchants who have the necessities of life to sell.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

Insurance
Company"**

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

"ANTI-HYDRO" Keeps this Bakery Dry

The concrete foundation walls and floor, parapet walls and window sills in this baking plant are waterproofed and hardened with "ANTI-HYDRO."

In one operation and at one cost "ANTI-HYDRO" permanently waterproofs and hardens concrete—even under the most severe conditions. It protects concrete from the action of acids, alkalis and oil. It increases the tensile strength of concrete and makes it improve with age.

"ANTI-HYDRO" is a liquid integral concrete hardener and water-proofer. It is easy and economical to use. Simply add it to the water used to wet down the concrete mix—no skilled labor required.

During the past 25 years "ANTI-HYDRO" has been successfully used in every type of concrete work—in all countries—under every kind of climatic condition. Satisfactory results are guaranteed. Use "ANTI-HYDRO" on your next job for permanence and economy.

Lay up masonry with

TROWLITE CEMENT

Trowlite Cement—a mixture of portland cement and hydrated lime for masonry mortar always in fixed, accurate proportions, is preferred by architects because of its unvarying quality; it is preferred by builders because it saves time on the job. Only one bag to handle and only sand and water to add.

Reliable WARNER Service brings Trowlite Cement to you in any quantity—and on time.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

PHILADELPHIA FIRE AND MARINE INSURANCE COMPANY

Owners, W. Clarke Grieb and Frank W. Cortright, 1617 Walnut street, Philadelphia. Stone, frame, 2½ stories, 70x58 feet, shingle roof, hardwood floors, hot water heat, tile and marble work.

Store (alts.), \$8,000. Doylestown, Pa. Contract awarded A. E. Eckert, Doylestown, Pa. Architects, MacKenzie & Wiley, Bankers' Trust Building, Philadelphia. Owners, W. P. Ely & Son, Doylestown, Pa.

Factory and Administration Building, Lansdale, Pa. Contract awarded Powell Construction Co., Ardmore, Pa. Architects, Franklin & Conner, Lansdale, Pa. Owners, Franklin Pottery Co., Lansdale, Pa. Brick, steel, 2 stories and basement, 500x80 feet, 120x68 feet, bond, excavation, reinforced concrete work, Lapitolith (L. Sonneborn & Son), concrete floors, screens, shades, steel stairs, awnings, steel sash (Lupton), steel doors (Lupton), gypsum slate, slag roof, carpentry and dumb waiter (Energy), caulking, metal lath, dampproofing (Toch Brothers), Sanymetal toilet partitions, sprinkler system, electric work, plumbing, wrought iron pipe, brass pipe, Hoffman controlled heating, boiler (Erie City Iron Works), oil burners.

Consolidated School, Kulpville, Pa. Contracts awarded. Architect, W. Marshall Hughes, 147 North Fifth street, Reading, Pa. Owners, Towamencin Township School Board, Leidy S. Kriebel, secretary, Lansdale, Pa. Brick, hollow tile, 1 story, built-up roof, composition floors, roof ventilators, bond, fire doors, steel sash. General contractor, H. C. Shallcross, Gratersford, Pa., \$16,930. Plumbing contractor, J. C. Troxel, R. F. D. 2, Lansdale, Pa., \$900.

Residence and Garage, Willow Grove, Pa. Contract awarded Stahl & Walton, Willow Grove, Pa. Architect, private plans. Owner, Charles H. Guent, 203 Allen lane, Willow Grove, Pa. Brick, frame, 2½ stories and basement, shingle roof, oak and pine floors, electric light, tile work.

Public Library, Bethlehem, Pa. Contract awarded F. F. Speck Construction Co., 51 West Walnut street, Bethlehem, Pa. Architect, H. J. Wiegner, Bethlehem Trust Building, Bethlehem, Pa. Owners, City of Bethlehem, 53 East Broad street, Bethlehem, Pa. Stone, brick, steel, 1 story and basement, 40x100 feet, slate roof, hardwood floors, vapor heat, electric light, tile work.

Residences (4), Elkins Park, Pa. Plans in progress. Contract awarded Allen Construction Co., 1642 Hunting Park avenue, Philadelphia. Architect, private plans. Owner, name withheld. Stone, frame, 2½ stories and basement, various sizes, shingle roof, oak and pine floors, hot water heat, electric light.

Road Work, Pennsylvania. Contracts awarded. Owners, Pennsylvania Department of Highways, James L. Stuart, secretary, State Capitol, Harrisburg, Pa.

Lawrence County, R-4918, North Beaver Township. One course reinforced concrete. J. D. Devine Co., Meadville, Pa., \$41,329.80.

Lehigh County, A-6052, Coplay Borough. One course reinforced concrete. Kulpmont Construction Co., Kulpmont, Pa., \$13,585.58.

Columbia County, A-5190, Berwick Borough. One course reinforced concrete. O. P. Bell Construction Co., Inc., Sunbury, Pa., \$59,777.24.

Residence, Newtown, Pa. Contract awarded C. Y. Stradling, Newtown, Pa. Architect, A. Oscar Martin, Doylestown, Pa. Owner, J. J. Burns, Newtown, Pa. Brick, 2½ stories, 40x26 feet, 16½x12 feet, asbestos shingle roof, hot water heat, stone foundations, electric light, tile work.

Residence and Garage, Norwood, Delaware County, Pa. Contract awarded Louis N. Devons, 13 North 13th street, Philadelphia. Architect, H. H. Kline, 709 Chestnut street, Philadelphia. Owner, Herman Oeschger, Franklin Trust Building, Philadelphia. Stone and clapboard, 2½ stories, 28x38 feet. Shingle roof, hardwood floors, hot water heat, tile work.

Hosiery Mill, Bloomsburg, Pa. Contract awarded Aaron C. Jury, Bloomsburg, Pa. Architects, The Ballinger Co., 12th and Chestnut streets, Philadelphia. Owners, Bloomsburg Hosiery Mills, Bloomsburg, Pa. Brick, steel 1 story, 61½x82 feet, sawtooth roof, cement floors.

ple Building, Camden, N. J. Owners, Pensauken School Board, care of H. B. Copehart, 221 North Forty-fifth street, North Merchantville, N. J. Brick, 1 story, built-up roof, cement floors, heating extension (heating, plumbing and electric separate).

Residences (8), Thirty-sixth street and Freemont avenue, Camden, N. J. Plans in progress. William G. Mummaw Co., 301 Morse street, Camden, N. J., will sub-let. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owner, name withheld. Brick, 2 stories, 18x32 feet, slag roof, pine floors, hot water heat, electric light.

Duplex Houses (3), Roosevelt and Freemont avenue, Camden, N. J. Plans in progress. William G. Mummaw, 301 Morse street, Camden, N. J., will sub-let. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owner, name withheld. Brick, 2½ stories, 22x35 feet, slate roof, hardwood and pine floors, hot water heat, electric light, tile work.

Fire House. Architects, P. L. Fowler Co., 224 East Hanover street, Trenton, N. J. Owners, Knottingham Volunteer Fire Co., care of architects. Location: Hamilton Township, N. J. Plans in progress. Brick, 2 stories, 35x60 feet, slag roof, reinforced concrete and hardwood floors, steam heat, electric light, steel sash.

Rooming House, Store and Apartment (add.), 119 South South Carolina avenue, Atlantic City, N. J. Owner ready for bids. Architect, Joseph E. Lippincott, Guarantee Trust Building, Atlantic City, N. J. Owner, Mrs. K. Jacobs, on premises. Brick, 3 stories, 22x40 feet, slag roof, hardwood floors, hot water heat, electric light.

College, 854-58 Federal street, Camden, N. J. Architects will be ready for bids in one week. Architects, Lackey & Hettel, 5 Hudson avenue, Camden, N. J. Owners, South Jersey Law School, Elmer G. Van Nomo, 503 Market street, Camden, N. J. Brick, limestone, 3 stories, 52x120 feet.

Dye House (add. and alts.), Atlantic City, N. J. Owners taking sub-bids. Architect, J. E. Lippincott, Guarantee Trust Building, Atlantic City, N. J. Owners, Rodman Cleaning & Dyeing Co., Delaware and Drexel avenues, Atlantic City, N. J. Brick, steel, second story add., 25x175 feet, slag roof, pine floors, roof ventilators, electric light, steel sash.

Hotel, Atlantic City, N. J. Preliminary plans in progress. Architect, J. R. Ogden, 143 South South Carolina avenue, Atlantic City, N. J. Owner, name withheld. Fireproof, 18 stories, 250x180 feet.

Shop, New York and Reading avenues, Atlantic City, N. J. Plans in progress. Architect, W. S. Hewitt, Guarantee Trust Building, Atlantic City, N. J. Owners, Fisher Sign Co., care of architect. Brick, 1 story, 60x80 feet, slag roof, concrete floors, hot water heat, electric light, steel sash, skylights, hollow metal doors.

Hotel, 3405 Pacific avenue, Atlantic City, N. J. Plans in progress. Architect, A. F. Amodio, Schwehm Building, Atlantic City, N. J. Owners, Penn Syndicate, care of H. D. La Cato, Schwehm Building, Atlantic City, N. J. Fireproof, 10 stories, 40x110 feet, slag roof, gypsum floors, elevators (2), metal weather strip, cast stone incinerators, ornamental iron, bond, iron stairs, fire doors, steel sash, vapor heat, electric light, oil burners.

Hospital Annex, Somers Point, N. J. Plans in progress. Architect, A. F. Amodio, Schwehm Building, Atlantic City, N. J. Owners, Atlantic Shores Sanitarium, Somers Point, N. J., care of Dr. Frank Inksetter, Somers Point, N. J. Brick, frame, steel, 3 stories, 36x80 feet, slag roof, maple and linoleum floors, safety treads, waterproofing, fire doors, steel sash, tile, marble, vapor heat, electric light.

Apartment, Atlantic City, N. J. Plans in progress. Architect, Bertram Ireland, Guarantee Trust Building, Atlantic City. Owner, name withheld. Steel, brick, frame, 3 stories, 35x78 feet, slag roof, hardwood floors, hollow tile, waterproofing, electric light, metal lath, tile work.

School, Millville, N. J. Architect, Alexander Merchant, New Brunswick, N. J. Owners taking bids due April 3rd, 7.30 P. M. Owners, Board of Education, E. W. Rumbf, Millville, N. J. Brick, cast stone, steel, 2 stories and basement, 159x114 feet, limestone, tile, marble, terrazzo, California stucco, metal lath, Straub cinder block, brass pipe, bond, excavation, reinforced concrete and cement work, Poretone (Porete Mfg. Co.), waterproofing, membrane hollow tile, ornamental plastering, Majestic coke chutes, iron stairs, metal window guards, safety treads, built-up roof (Johns Manville or Barrett), roof ventilators (Royal or equal), rollet steel skylights, metal toilet partitions, composition floors (Rubberstone, Tiletex or equal), linoleum floors, kalamein doors, maple floors. Certified check, 5 per cent. Deposit, \$25, refunded.

Residence and Garage, Montclair, N. J. Architect taking bids due April 1st. Architect, John T. Simpson, 45 Walnut street, Newark, N. J. Owner, Frank Gibson, Montclair, N. J. Stone, 2½ stories and basement, 51x28 feet, slate roof, oak and pine floors, plumbing, hot water heat, electric light, metal lath, tile work, ornamental iron work.

Apartment, North Side, Atlantic City, N. J. Owner sub-letting. Architect, Bertram Ireland, Guarantee Trust Building, Atlantic City. Owner, R. G. Edwards, Carolina Crest Hotel, Atlantic City, N. J. Brick, steel, 3 stories, 34x145 feet, slag roof, pine floors, hot water heat, electric light, tile work.

Municipal Building and Court House, Camden, N. J. Owners will be ready for bids within two weeks. Architects, Edwards & Green, 548 Federal street, Camden, N. J. Owners, Commissioners of the City of Camden and Camden County Board of Chosen Freeholders, Court House, Camden, N. J. Granite, steel, brick, 5 stories (tower, 21 stories), 138x356 feet, deck promenade, tile roof, concrete floors, hollow tile, elevators, safety treads, roof ventilators, metal window guards, waterproofing, dampproofing, wire work, acoustical treatment, area gratings, bronze, wrought iron pipe, brass pipe, ornamental iron work, soundproofing, iron stairs, bond, kalamein doors, hollow metal doors, steel skylights, steel sash, tile, marble, terrazzo, metal lath (heating, plumbing and electric work separate).

Residences (5), \$25,000. 1490-98 South Ninth street, Camden, N. J. Permit issued. Architect, private plans. Owner, Conrad Lambert, 1427 South Ninth street, Camden, N. J. Brick, 2 stories, 14x48 feet and 16x55 feet, slag roof, hardwood and pine floors, hot water heat, electric light.

Dormitory, Colony for Feeble Minded, New Lisbon, N. J. Low bidders. Architects, Division of Architecture and Construction, Trenton, N. J. Owners, Department of Institutions and Agencies, William J. Ellis, Commissioner, State House, Trenton, N. J. Reinforced concrete, steel, brick, stucco, 2½ stories, 200x60 feet, maple floors, asbestos shingle roof, hollow tile, waterproofing and dampproofing, wire work, cast stone, blue-stone, caulking, ornamental iron, iron stairs. General: Hugh B. Miller, Edgewater Park, N. J., \$41,199; J. E. Kolster, Beverly, N. J., \$42,894. Plumbing: Burns, Lane, Richardson Co., New Brunswick, N. J., \$4,725. Heating: George D. Worrell, Mt. Holly, N. J., \$3,848. Electric, Ernest S. Milligan, Mt. Holly, N. J., \$2,019.

Dairy Barn, Colony for Feeble Minded,

New Lisbon, N. J. Low bidders. Architects, Division of Architecture and Construction, Trenton, N. J. Owners, Department of Institutions and Agencies, William J. Ellis, Commissioner, State House, Trenton, N. J. Stucco, steel, 1 story, 60x32 feet, slate and shingle roof, concrete floors, roof ventilators, metal window guards, caulking. General: J. E. Kolster, Beverly, N. J., \$3,725; William C. Cook, Mt. Holly, N. J., \$4,484. Plumbing: George C. Worrell, Mt. Holly, N. J., \$415. Electric: Peter Peifer, Trenton, N. J., \$215.

Senile Building, Greystone Park, N. J. Owners taking revised bids due April 3rd. Architects, Division of Architecture and Construction, Trenton, N. J. Owners, Department of Institutions and Agencies, William J. Ellis, Commissioners, State House, Trenton, N. J. Brick, steel, 2 stories and basement, 223x56 feet, Johns Manville built-up roof, bond, excavation, membrane waterproofing integral waterproofing, dampproofing, cinder concrete block, limestone, granite, blue-stone, iron, iron stairs, metal window guards, area gratings hollow metal doors and trim, kalamein doors and sash, slate roof, cement and maple floors, steel lockers, caulking, linoleum, tile, marble, Alberne stone, painting, glazing.

Bridge, over Morris avenue, Route 29, Sec. 2A, Union County, N. J. Owners taking bids due April 8th at noon. Owners, State Highway Commission, A. Lee Grover, Chief Clerk, State House Annex, West State street, Trenton, N. J. Concrete, reinforcing steel, structural steel, asphalt block, concrete piles, excavation. Certified check, 10 per cent. Deposit, \$10.

Road Work, New Jersey. Low bidders. Owners, State Highway Commission, A. Lee Grover, Chief Clerk, State House Annex, Trenton, N. J. Route 25, Section 20, Contract 23, from Grove street to City Line at Edgar road, Elizabeth, Union County, N. J., A. Stryker, Inc., \$214,998.50. Alexauken Creek Bridge over Alexauken Creek, Route 29, Hunterdon County, N. J., F. L. Grant Co., West Chester, Pa., \$20,046.60.

Contract 122, Highway Bridge, Delaware Township, N. J. Low bidder, E. P. Henry & Son, Woodbury, N. J., \$24,907.15. Architect, private plans. Owners, Camden County Park Commissioners, Wilson Building, Camden, N. J. Reinforced concrete, 118 feet long, curbs, sidewalks, paving, 58,477 pounds reinforced steel, 1,680 feet hardwood piling, 176 feet L. L. Y. P. railings, 806 square feet, waterproofing, bronze plate.

Contract 121, Street Grading. King's Highway along Cooper River, Earlton, Delaware Township, N. J. Low bidder, W. Penn Corson, 119 White Horse pike, Haddon Heights, N. J., \$11,307.50. Architect, private plans. Owners, Camden County Park Commissioners, Wilson Building, Camden, N. J. 19,100 cubic yards grading.

Exchange Building, Woodbury, N. J. Plans in progress. Architect will be ready for bids in 10 days. Architect, John T. Wimdrim, Commonwealth Building, Philadelphia. Owners, Bell Telephone Co., of New Jersey, Woodbury, N. J. Brick, 2 stories.

New Jersey Contracts Awarded

Hotel, \$75,000. Eighth street, near Boardwalk, Ocean City, N. J. Contract awarded without competition to D. A. McClelland, Drexel Building, Philadelphia, who will be ready for sub-bids in a week. Architect, George S. Idell, 1510 Chestnut street, Philadelphia. Owners, Hanscom Brothers, Inc., 734 Market street, Philadelphia. Brick, steel, 6

stories and basement, 40x75 feet, slag roof, cement, oak and pine floors, elevators, electric light, metal lath, tile work steam heat, medicine cabinets.

Hotel (add.), South Arkansas avenue, Atlantic City, N. J. Contract awarded Raymond Wochner, 1408 Emerson avenue, Venice Park, N. J. Architect, A. L. Brooks, Humphreys Building, Atlantic City, N. J. Owner, name withheld. Brick, steel, 3 stories, 50x16 feet, slag roof, hardwood floors, metal weather strip, copper work, skylights, tile, marble.

Stores (2) and Apartments (3), Maple Shade, N. J. Contract awarded H. Bowman, 1047 Beideman avenue, Camden, N. J. Architect, Arnold H. Moses, Temple Building, Camden, N. J. Owners, Leonard's Department Store, Maple Shade, N. J. Brick, concrete block, 2 stories, 50x65 feet, slag roof, pine floors, waterproofing and dampproofing, steel sash, electric light, hot water heat.

Residences (22), \$3,500 each. 200-22 and 201-19 Morse street, Camden, N. J. Contract awarded Whittaker Brothers, 5417 South Browning road, Pensauken, N. J. Architect, Charles H. Roberts, 112 South Sixteenth street, Philadelphia. Owners, Bridge-Garden Corporation, 325 Market street, Camden, N. J. Brick, 2 stories, 18x38 feet, Carey roof, hot water heating, electric lighting.

Contract 30-5, Swimming Pool, Gloucester City, N. J., \$24,290. Contract awarded Robbins Contracting Co., 1137 North Front street, Philadelphia. Architects, Lackey & Hettel, 5 Hudson avenue, Camden, N. J. Owners, Camden County Park Commissioners, Wilson Building, Camden, N. J. Reinforced concrete, 180x100x9 feet, 338 feet wire fence, wrought iron pipe.

Locker Room and Recreation Building, Gloucester City, N. J., \$46,402. Contract awarded Robbins Contracting Co., 1137 North Front street, Philadelphia. Architects, Lackey & Hettel, 5 Hudson avenue, Camden, N. J. Owners, Camden County Park Commissioners, Wilson Building, Camden, N. J. Cinder block, stucco, 2 stories, 100x57 feet, Barrett Specification roof, cement floors, metal partitions, lockers, electric light, steel sash, stools.

Miscellaneous Construction News

Auditorium, Newark, Del. Architect will be ready for bids in 10 days. Architect, Charles Z. Klauder, 1429 Walnut street, Philadelphia. Owners, University of Delaware, Newark, Del. Brick, marble, fireproof, 1 story and gallery, 72x125 feet, seating capacity 1,000.

Residence, Westover Hills, Wilmington, Del. Architect taking bids due March 28th. Architect, S. W. Pike, 1520 Locust street, Philadelphia, and 105 Creston avenue, Audubon, N. J. Owner, Earl E. Edinger, 1501 West Ninth street, Wilmington, Del. Brick, steel, 2½ stories and basement, 37x35 feet, wing 42x16 feet, wing 15x12 feet, bond, demolition, excavation, Master Builders' plaster bond, limestone, flagstone, concrete work, area gratings, metal lath, copper roof, plastering, shingle roof, tile and marble work, oak and pine floors, metal casement sash, hardware, plumbing, wrought iron pipe (Byers or Reading), brass pipe, electric work, vapor heating, lighting fixtures, screens, weather strip, linoleum and cork floors, hardware, plumbing fixtures, wrought ornamental iron work.

Grade School, Minguadale, Del. Owners taking bids due April 1st. Owners, School Building Committee, Perry E. Swanson, Tenth and King streets, Wilmington, Del. Brick, concrete and timber roof, 1 story, 159x31 feet.

Certified check, 5 per cent., or bid bond. Deposit, \$25, refunded.

Grade School, Stanton, Del. Owners taking bids due April 8th. Owners, School Building Commission, Charles P. Dickey, Stanton, Del. Brick, concrete, timber roof, 1 story, 144x37 feet. Certified check, 5 per cent., or bid bond. Deposit, \$25, refunded.

School, Rose Hill, Del. Owners taking bids due April 8th, 2.30 P. M. Owners, School Building Commission, Perry E. Swanson, Eleventh and King streets, Wilmington, Del. General construction, steel, iron, roofing, painting, masonry, carpentry, plumbing, heating, electric, ventilation. Certified check, 5 per cent., or bid bond. Deposit, \$25, refunded.

Road Work, Delaware. Owners taking bids due April 9th, at 2 P. M. Owners, State Highway Department, Dover, Del.

Contract 2D, Garrison's Mill and Roadway and Bridge Replacement. Excavation, borrow, cement concrete pavement, concrete reinforcement, corrugated metal pipe, removal of temporary bridge, wood guard rail, timber piling, sheet piling.

Contract 104B, Milford Bridge, Steel Superstructure. Structural steel, track plates, machinery, locks buffer, traffic plates, reinforced steel, B. M. flooring, concrete counterweight, concrete roadway, pipe railing, motor, electric equipment, operator's house.

Contract 113, Law's School-Harrington, 4.77 miles. Clearing, grubbing, excavation, borrow, broken stone base course, cement concrete pavement, reinforcement, corrugated metal pipe, R. C. pipe, wood shoulder curb.

Contract 120, Laurel-Independence School, 3.73 miles. Excavation, borrow, broken stone base course, cement concrete pavement, Class A concrete, corrugated metal pipe, reinforcement, R. C. pipe, wood shoulder curb. Certified check, 10 per cent. Deposit, \$2.00.

Chapter House, University avenue, Ithica, N. Y. Architect taking bids due as soon as possible. Architect, Otis Fuller, 6 North Michigan avenue, Chicago. Owners, Alpha Chi Rho Fraternity, Phi Theta Building Association, on premises.

Miscellaneous Contracts Awarded

School, Farmington, Kent County, Del. Contracts awarded. Architects, Guilbert & Betelle, Chamber of Commerce Building, Newark, N. J. Owners, State School Building Commission, Dr. H. V. Holloway, Dover, Del. Brick, concrete, timber, 1 story 92x34 feet. General contractor, Andrew J. Murray, Georgetown, Del., \$20,000.

Building Alterations, 6th avenue and 50th street, New York City. Contract awarded Huhn Smith Harris, Inc., 225 West 34th street, New York City. Architects, Stuckert & Co., 1600 Arch street, Philadelphia. Owners, Bickford's Lunch System, 362 West 50th street, New York. Granite, brick, steel, 1 story 20x30x75 feet, bronze work, steam heat, revolving doors, electric work, tile, marble and terrazzo floors, architectural terra cotta, plumbing.

John Charles Norton, Architect, of Ardmore, Pa., has opened a branch office for the convenience of his suburban clientele at 336 Lenox Road, Brookline, Upper Darby, Pa. Samples and catalogues requested.

David Supowitz and Shander Berger, Associated Architects, have moved their offices to 260 South Fifteenth Street, Philadelphia.

J. B. Harman, Architect, 54 North Queen Street, Lancaster, Pa., will be located after April 1st, 1929, in the new Fulton National Bank Building, Lancaster, Pa.

BUILDING INDUSTRY HOLDS KEY TO FIRE-SAFETY OF FUTURE

A service of utmost importance to America can be rendered by the construction industry—a service that may result in saving hundreds of human lives and millions in property values. The industry is establishing standards and endeavoring to raise the efficiency of methods in order to eliminate duplication of effort and to curtail waste. Now a new element comes to the fore. The construction of fire-safe buildings is of equal importance with the other achievements of the industry. In fact, building to resist fire is essential to the nation's economic welfare, for when a building is destroyed by fire there is a senseless waste of materials. A loss caused by interruption of business or occupancy of the home, follows. Both builders and owners have reason to be interested in fire-safe construction: one from a professional viewpoint, the other from a business angle. As a matter of fact, from the owner's standpoint, the better the protection against fire, the lower will be the cost of insurance.

No longer are fire insurance companies merely distributors of losses; they are now charged with the public service of preventing fires and the resultant losses. The reason for their interest in fire-safe construction is therefore evident. Again, since insurance is the basis of credit, it is an important associate of the construction industry, which is dependent upon credit for the means to operate.

A sure way to curtail America's intolerable fire waste is so to construct buildings that they will resist fire originating within or without until the firemen arrive, and to use combustible materials where necessary in such a way as not to increase the burning rate of the structure. So large an objective cannot be obtained quickly; it must come as a process of evolution, starting in the design, where architects are in a position to do much for the future fire-safety of the country. Apparently architects in the past have been concerned principally with the three factors of appearance, arrangement and cost of the buildings they designed, while the element of fire-safety received much less attention. Some, indeed, made a careful study of fire prevention engineering, but on the average little interest was evidenced beyond the specific requirements of building codes. This does not imply that architects opposed fire prevention, but simply that they failed to realize the urgent importance of the subject because it had never been presented to them with sufficient force.

Presumably building laws throughout the United States were prepared after consideration of purely local problems,

rather than scientific data or the experience of the entire country, for there is a wide diversity in many of the fundamental requirements. As a result, an architect who is called upon to design structures in different communities may find that requirements vary considerably. Probably waste in the use of building material results. . . . Standardization of building laws is a basic factor in the elimination of waste of materials during construction, as well as in curtailing fire losses, and the importance of such a program is evident.

For a number of years The National Board of Fire Underwriters has been actively endeavoring to educate the public how to build safely and to protect individual buildings and cities. It has compiled a model building code, describing safe construction, which it distributes gratis to those interested in the subject. Not only the National Board, but also the insurance rating and inspection bureaus in the various states, stand ready at all times to give advice, free of charge, upon building ordinances or methods of construction which will aid in lessening the great annual fire waste. A number of cities have adopted this model code as a whole, while many others have used extracts from it freely in the preparation of local building laws. In order to co-ordinate all the present-day information affecting building construction, the National Board's Recommended Building Code is now undergoing careful revision.

While he was Secretary of Commerce, President Hoover recognized the necessity for a central co-operating body to standardize, as far as possible the building laws of the country, and he organized the Bldg. Code Comm. for that purpose. Composed of well-known experts in various branches of building construction and insurance, this voluntary committee was given the benefit of constructive criticism by manufacturers, industrial associations, architectural and engineering societies and others, and a report was submitted to the Secretary of Commerce on recommended minimum requirements for small dwelling construction, part of which was briefly stated in the form of ordinances for municipal adoption.

As the Government printed this report and distributed thousands of copies throughout the country, one beneficial result was the practical use of it in building codes by municipalities; another was greater uniformity in codes throughout the country. Undoubtedly it also proved useful to owners and builders of dwellings generally. The Committee has continued its work to the present day, making seven reports on recommended minimum requirements for building construction. There can be no great benefit from these codes, however, unless architects and the construction industry co-operate

by putting into every building upon which they work the general requirements of fire-safe construction. When this co-operation is a fact, a long step forward for public welfare will be realized.

Many buildings are more or less fire-resistant, but a much greater number will burn very readily; if they are to be built to last and not to burn it is highly essential that the materials which go into their construction shall be of a superior type, at least so far as cost and other conditions warrant.

PRICES, PROFITS AND LABOR SAVING EQUIPMENT

"Profitless prosperity" is the phrase many business men are using to describe the state of their affairs. It means that they have plenty of business but it is taken at such low prices as not to afford a profit. In many respects this is true in the construction industry where there is such a tendency to cut prices that much work is being done better without profit or at a loss.

This was recently shown by Magnus W. Alexander speaking before the New York Building Congress, when he pointed out that although the number of companies engaged in construction work increased from eight thousand to fifteen thousand between 1918 and 1925, only thirty-seven companies reported a net income of more than \$100,000 during this entire eight year period.

The point stressed by Mr. Alexander, which is one that the whole building industry may well consider, is that with price competition as keen as it is, builders must make use of every possible labor-saving device and equipment. Building activities must be "mechanized" and engineering research and equipment must be used to speed up work and cut down costs by use of building machinery and equipment.

Development of construction equipment will not only reduce overhead and cut costs but will tend to prevent labor troubles, Mr. Alexander points out. As competition in the building industry continues to grow more keen, this is the only path open for builders who may hope to continue to run a profitable business.

—*Building Age.*

SIMPLIFYING MILLWORK SPECIFICATIONS SAVE MONEY

One of the very worthwhile activities spurred on by that very worthwhile organization, the Building Congress, is the attempt to organize local branches of the construction industry to simplify designing, specifying, estimating and contracting of building materials. The first step has been the publication of a report giving simplified specifications for best local

practise with respect to millwork and finished lumber.

Representatives of the leading organizations engaged in cutting, estimating, contracting, erection or use of architectural woodwork have co-operated to develop standard specifications for this material.

The specifications agreed on thoroughly cover the use of lumber, carpentry and millwork, including such matters as grades and sizes, seasoning, kinds and qualities of work, thickness, stock finishes and various other details such as, for example, ious other details such as, for example, dow, exterior hardwood, veneered door, window sills and tongued casings.

This practise of getting all the men in a given branch of the building business together and having them agree on standard recommendations for their products, is extremely beneficial to the members of the industry in that locality. Philadelphia may well be proud of the steps its builders are taking to eliminate confusion and waste, and other cities may well follow in her footsteps.

WE ASK YOU

Isn't it funny?
THAT A MAN WHO CONSIDERS
HIMSELF A BUSINESS MAN
Will get up in the morning
From an advertised mattress,
And put on advertised underwear,
Advertised hose, shirt, collar, tie and shoes.
Seat himself at a table and
Eat advertised breakfast food,
Drink advertised coffee or substitute,
Put on an advertised hat,
Light an advertised cigar,
Go to his place of business and
TURN DOWN ADVERTISING ON THE
GROUND THAT ADVERTISING DOESN'T
PAY!

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

"Facts are stubborn things." Advertise only the truth about your product and watch the result.

The man who starts out with the idea of getting rich won't succeed; you must have a larger ambition. There is no mystery in business success. If you do each day's task successfully, stay faithfully within the natural operations of commercial law, and keep your head clear, you will come out all right.
—John D. Rockefeller.

Insurance
Company"**

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

"ANTI-HYDRO" Keeps this Bakery Dry

The concrete foundation walls and floor, parapet walls and window sills in this baking plant are waterproofed and hardened with "ANTI-HYDRO."

In one operation and at one cost "ANTI-HYDRO" permanently waterproofs and hardens concrete—even under the most severe conditions. It protects concrete from the action of acids, alkalis and oil. It increases the tensile strength of concrete and makes it improve with age.

"ANTI-HYDRO" is a liquid integral concrete hardener and water-proofer. It is easy and economical to use. Simply add it to the water used to wet down the concrete mix—no skilled labor required.

During the past 25 years "ANTI-HYDRO" has been successfully used in every type of concrete work—in all countries—under every kind of climatic condition. Satisfactory results are guaranteed. Use "ANTI-HYDRO" on your next job for permanence and economy.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

"ANTI-HYDRO"

Waterproofed Concrete now GUARANTEED for 25 Years

For the first time in the history of the building industry a concrete waterproofer and hardener is now backed by the most sweeping guarantee ever written.

During 25 years of continuous use for every type of concrete protection, "ANTI-HYDRO" has stood every test to which it has been subjected. In fact "ANTI-HYDRO" jobs *improve* with age. The earliest installations—25 years old—stand today as positive evidence of the permanence of "ANTI-HYDRO" results.

The original "ANTI-HYDRO" formula—*more* than 25 years old—has not been changed during this quarter-century of use. Another worthy record which proves the efficiency of the "ANTI-HYDRO" method, in spite of the many new uses for concrete.

"ANTI-HYDRO" is a liquid, integral compound which makes concrete permanently hard and waterproof as well as acid, alkali and oil resisting—in *one operation*. It is easy and economical to use. It is an anti-freeze accelerator. It increases the tensile strength of concrete. It also waterproofs cement mortar, dampproofs masonry and prevents, to a marked degree, efflorescence stains coming from the mortar.

The "ANTI-HYDRO" sales franchise gives you exclusive dealer protection and real 100% co-operation from the home office and from every "ANTI-HYDRO" man in the field. If there is no "ANTI-HYDRO" dealer in your locality, write at once for complete details.

Use "ANTI-HYDRO" on your next job.

TAKING EMBARRASSMENT OUT OF THE HOME

By R. E. HOWARD, A. B.

*Secretary Colgate Psychological
Laboratory*

Perhaps the house does not now exist which at some time or other has not caused the housewife embarrassment. This may not happen very often or be of any great strength, but the fact is that it has for some reason been embarrassing to live in that particular house.

On the Ground When Wanted

Columbia 6526-6527

Park 4981

We often hear house owners say that they will never again buy a house already built but will have one constructed which will include this or that feature and will also omit some features of their present dwelling. With this in mind let us look at some of the embarrassing features found in the average modern house.

Not long ago a lady in a rather large town was expecting some visitors from another city. The house had been described, as is often the case, by merely giving the street and number. The hour for the arrival came, but the visitors, who were coming over in a private automobile, did not appear. Soon one of the members of the family saw a car moving slowly up the street. At the end of the block it turned and slowly came back. This process was repeated several times until finally the car came to a halt in front of a neighbor's house and one of the party alighted and went into the house. In a few minutes he returned to the car and gave the driver some directions. The car then started up, and drew up to the curb in front of the correct house.

The lady of the house learned upon receiving the guests that some twenty minutes had been lost in finding the house. She was surprised until she remembered that the house numerals were on the front door, hidden in the shadow of the deep porch, instead of on the column where they could be seen from the street. Her embarrassment was great, and the next day the numerals were changed.

In some cities the house numerals must be placed on the column nearest to the steps and to the right of them. Such a system makes addresses easy to find because one gets a habit of looking for them in a certain position. Much wasted time is saved by this means.

In your home, is the stairway to

the second floor accessible without passing through rooms on the first floor? The man of the house who has a hobby of a garden does not wish to pass through a living room where his wife is entertaining her bridge guests in order to reach his room and dress for dinner. The guests may know that the garden is his hobby, but they are not at ease if he must rush through the room in which they are seated in order to reach the stairway. The type of home which has the combined reception hall and living room with the stairway rising from it is more prone to cause embarrassment than any other.

The movement on hand for the elimination of the dining room seems to be loaded down with possibilities for embarrassment. This new plan makes the dining place an alcove connected with the living room. Here, unless care is taken in planning, the casual visitor who comes to the house on business at meal time—and the number who do this is by no means small—will have to sit in the living room section and watch the progress of the meal at the other end of the room. This is embarrassing for both parties.

If the person to be seen decides to interrupt his meal and interview the caller, unless the dining room is in some way secluded, he will have to allow every one dining to listen to his conversation. This state of affairs is not pleasant. Unless the house with the dining alcove has a hallway or vestibule in which persons can talk, the situation is nearly hopeless.

Houses in the cities are often too close to the street for the elimination of embarrassment by natural means. The person walking along some of our city streets can easily see all that is happening in the front rooms of the first floor. If the house is in this location, the use of cur-

tains of sufficient thickness to keep out these interested but unwelcome eyes is the best solution.

The same house, or even the house which sets back from the street, is subject to embarrassment from silhouettes formed on the window curtains. Two methods may be used to overcome this. The most common method seems to be the installation of double curtains at all windows or else the use of shades which are dark on the outside and white on the inside. The formation of shadows is then lessened, as the outsider cannot see them. The other and less common method is to place your wall lights so that they cast shadows into the room and not against the shades. Lights placed against the wall and near the window frames will throw the shadows into the centre of the room. Another method, practically never seen in homes, is the use of indirect lights which cast no shadows at all. In the home already constructed the opaque shade is the cheapest solution.

Not long ago a young man in New Jersey built a rather attractive house on a small lot between two dwellings. The house looked very well on the blueprints but the owner was very much embarrassed when he found after the house was up that it had been placed so that the neighbors on either side could look from their windows directly through his living room. The windows in living room and hallway were opposite each other and these corresponded with the neighbors' windows. The two front rooms were separated by an archway, and thus the clear vision through the new house. A slight bit of forethought in connection with the placing of the house upon the site would have saved much embarrassment later. Houses which are similar and in rows are often troubled in this manner, the windows being placed so that one

can look through the entire row and see the sunlight beyond.

Often in traveling through cities one sees houses which seem to have outgrown their sites. Such was the case with the Jones house. The lot was very narrow but the wife had wanted a wide house. They have a wide house but have never been free from embarrassing situations since. The first bit of trouble arose when the man called with the winter's supply of coal. The side of the house was too close to the neighbor's hedge to allow a chute to be placed in the cellar window. The coal had to be taken around to the rear and then through the cellar to the storage place.

The next bit of unpleasantness came when the owner purchased a new car and found that there was not room enough on either side of the house for a drive. The rear of the house had plenty of room for a fine garage but it was not accessible.

For the family which has a car, it is embarrassing to have no place to stop in bad weather and allow passengers to alight, without being exposed to the elements. A small step from the side of the porch or a side entrance will solve this problem.

Floors that squeak are always embarrassing. Even the comic artists have noticed the value of these floors in creating embarrassing situations. The house may be new and of good construction, but squeaky floors always give the impression of a cheap grade of work. No owner likes to have his visitors get the impression that his house is a cheap one, but unless the house is very old, where such floors add to the charm, the only possible idea is that the material and labor were cheap. With good floors within the reach of all builders it seems impossible that poor floors should be allowed.

Whose forethought is it that is going to prevent these home embarrassments? In many cases that of the builder. He must be able to see these things before they happen and provide against them, just as he provides against leaky roofs and other faults.

HOW TO FINISH HARDWOOD FLOORS

Floors Properly Finished Have High Sale Value and Leave Quality Impression

By A. ASHMUN KELLY

This work differs with all other finishing in that it is to be walked upon; hence it must receive a different treatment. It demands a greater length of time for drying, unless, as is often the case, a very quick and hard-drying finish is applied.

There are finishes which may safely be walked upon without damage inside of ten to twelve hours, and even in less time than this where the very quickest finish is used. Of these we now have many that were not dreamed of some years ago.

But to begin with, time is a requisite. Every stage of the work demands time for drying in order to produce a perfect finish, both as to durability and appearance. But time is not always available. Since there are cases where the owner is over anxious to get into the new home, the work does not permit of enough time for the best results. The finishing materials, filling and succeeding coats, should each have all the time necessary to their drying out.

Even after a floor has been laid it should have some time to "work and set," as the floor-layer might say. This workman says that seven or eight days with a warm room should be allowed for this.

But how very seldom does a floor get that much time to work and set.

Then, a good floor should be covered to afford protection against injury. First-class floors get this, but hardly any others. I am writing this in a fine house whose floors are of fine select hard pine, and they have been ruined by not having been covered with boards when the plastering was done. Yet they are finished natural, but with every dark stain showing at the sides and ends. And, strangely enough, this house was built by a building contractor for his own family, who lived in it till almost the last member died.

Floors Should be Scraped and Sandpapered

A good floor will be scraped and sandpapered perfectly level and smooth. The machine used for this purpose will sandpaper with No. 1½ paper for the first cutting, finishing with No. 00 paper, which gives to the surface a sort of polish. The machine first runs across the grain, then with the grain. A few inches around the sides will be done with a hand scraper, finishing with sandpaper and block.

Then the floor will be made clean, the last sweeping being done with a broom covered with flannel slightly dampened with raw linseed oil. This will take up the fine dust left from the sweeping.

A clear grade of oak flooring should be filled with uncolored paste filler, or with a little oak color added to it. Select and sap grades should have a light golden oak filler. After the floor has been filled it should be gone over with a little burnt umber to darken any possible light streaks. Thin the umber with turpentine.

This will cause the select and sap grades to have the appearance of clear grade, excepting that they will look slightly darker. In filling No. 1 common grade a dark golden oak color should be

used, and any light streaks should be darkened as above.

After filling the floor allow it about twenty minutes to set; then rub off with burlap or tow, rubbing against the grain. Then let the work stand for twenty-four hours; then, sandpaper smooth and apply a coat of surfacer. For a surfacer some workmen use copal varnish made sufficiently thin with turpentine. Now repeat the sandpapering. For a good job apply two coats of rubbing varnish; rub the first coat to remove the gloss, then rub the second coat with powdered pumice stone and water. Now clean up, let the work become dry, after which finish as desired, varnish or wax.

Shellac is often best for a hard pine floor, as copal varnish does not wear so well or does better when used over shellac. But some workmen say that neither shellac nor copal varnish should be used, but that the wood should be stained with a dark oil stain, wiped off, and then when dry have a coat of equal parts of raw oil and turpentine which should be wiped off dry. First wipe across the grain after the dark oil stain, which should remove the stain from hard parts and place it in the softer parts; finally wipe the surface dry with a dry clean cloth. Repeat this operation till the wood will take up no more stain.

A hard pine floor treated in this manner will neither scratch nor wear off in spots, and it is easily renewed when that becomes necessary. Such a finish does not become slippery, and becomes even more attractive with age, the color darkening and mellowing.

If the floor is to be finished natural, first apply a liquid filler, pale in color, or a coat of white shellac, following this with pale copal varnish, or with wax, or two coats of white shellac.

In doing a hardwood floor you should work on the principle that few coats mean better wearing.

Open Pore Woods Need Paste Filler

A floor of any open pore wood should be filled with paste filler; do not use a liquid filler in this case. Finish with copal varnish or shellac or varnish, as may be preferred. Some finishers will give the floor two coats of shellac and call it done. Others may prefer two or more coats of a good floor varnish. But the majority of finishers will vote for the wax finish, in some cases applied over a filler, but more commonly over a thin coat of shellac, applied over the paste filler.—*Building Age and National Builder.*

The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides: its cost, and other details, without obligation.

CROWE SHORTENS THE BETWEEN TWO POINTS

A straight line is short to a Crowe Safety Saw—no matter how long it looks. One man can cut it in less time than ten men with ordinary saws.

It works continuously. Driven by a G. E. motor from a 110 or 220-volt socket, it has lots of power, gearing does not heat, and the operator is given absolute protection. Blades are standard. Body is of aluminum alloy, making it easy to carry.

Anywhere a hand saw is used—and some places where it can't be used—the Crowe Safety Saw does the work better, and stands punishment longer than any other portable electric saw on the market.

Write for further information.
Two cents invested now will
bring you big dividends later.
Slip that inquiry in the mail to-
day.

"CROWE SAFETY SAW"
CUTS THE COST

Crowe Safety Saws are patented. Equipped with ball bearings throughout. General Electric motors and Ingersoll-Rand motors used. Any type of blade supplied as ordered. Cutting line is always in sight.

Crowe Safety Saw is made in four sizes, giving you a wide range of efficiency.

For those jobs where electricity is not available, a Crowe Air-Driven Safety Saw has been built. It has all the excellent qualities of the electrically-driven saw.

Whatever your needs might be, if you cut lumber on the job, a Crowe Safety Saw will bring you exclusive advantages you will appreciate.

Officially approved for safety by industrial commissions, listed as standard by Underwriters' Laboratories, and recommended by insurance companies.

Cuts up to 6 1/8 inches. Made in four sizes.

Warner Company

1518 WALNUT STREET,
PHILADELPHIA, PA.

April 6, 1929

ANNOUNCEMENT

The enlarged Warner Company (formerly Charles Warner Company), has acquired the properties and business of The Van Sciver Corporation.

The operations of these two companies have been substantially parallel, resulting in wasteful duplication of effort and facilities.

It is believed that Warner Company, by this acquisition, will be able to function more efficiently and that material economies, particularly in transportation and distribution, will be effected.

The enlarged Warner Company will have as its objective the constant betterment of its service and the continuance of the reputation of both predecessor companies for quality products.

It will be both our duty and our pleasure to carry out this policy in assuming these broad responsibilities.

Warner Company

President

*"The Oldest
American
Fire and Marine
Insurance
Company"*

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

PHILADELPHIA

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Bennett, 633 South Grant street, Wilmington, Del. Brick, 2½ stories, slate roof, 36x30 feet, hardwood floors, hot water heat, electric light, tile work.

Proposals

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., April 9, 1929—SEALED PROPOSALS will be opened in this office at 3 p. m., April 29, 1929, for furnishing all labor and material required for furnishing and installing motor generator, etc., in the U. S. Mint at Philadelphia, Pa. Specifications may be obtained from the custodian at the U. S. Mint at Philadelphia, Pa., or at this office in the discretion of the supervising architect, JAS. A. WETMORE, Acting Supervising Architect.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., April 15, 1929.—SEALED BIDS will be opened in this office at 3 p. m., May 13, 1929, for remodeling and enlarging the U. S. post office at Oil City, Pa. Drawings and specifications may be obtained from the custodian of the building, or at this office in the discretion of the supervising architect. JAS. A. WETMORE, Acting Supervising Architect.

Many a man would do a better job if he didn't know about putty.—Ex.

CHARLES WARNER COMPANY

A transaction involving over \$10,000,000, the largest in the building field of the Philadelphia district for sometime, took place recently when Charles Warner Company purchased the business and holdings of the Van Sciver Corporation of Philadelphia and thereby became the largest firm in the lime, sand and gravel field in the world. It is believed that by combining the two companies material savings will be effected by eliminating duplication of forces and equipment and that this will do away with the necessity for increased prices of these products which otherwise might have taken place, in the Philadelphia markets.

Charles Warner Company is one of the oldest commercial organizations in the United States, having a century and a quarter of continuous operation to its credit. The company was organized in 1794, during the second presidential term of George Washington, and has remained under the direction of members of the Warner family since that time. In that year, John and William Warner of Wilmington, Delaware, formed a partnership for the purpose of carrying on a transport and trading business. For this purpose, they used a site at the foot of Market Street in Wilmington. This property has been in possession of the Warner family for over 200 years and at present is used by the Wilmington Retail Yard. The original Warner Company operated a line of packets between Wilmington and Philadelphia and traded with the West Indies. The Company also carried on a general wholesale business.

Throughout the entire 134 years of its existence the Company has shown a steady growth and today there is a vast difference between the present organization, employing over 1500 men and women in its various plants and offices, and the little trading company formed during colonial days. The firm gradually concentrated upon building materials and imported considerable quantities of Portland Cement from England long before it was made in the United States. The Company purchased a lime plant as long ago as 1886 and from time to time added sand, lime, gravel and concrete mixing plants in various parts of Pennsylvania and New Jersey until it became one of the largest producers of its kind in the country.

Before buying the Van Sciver Corporation, the Warner Company owned thirteen plants and retail yards. Included in this number were the retail yards of the West Jersey Sand & Supply Corp. and the Merion Lime and Stone Company lime plant. The Charles Warner Company also controls and operates the American Lime & Stone Co. with extensive holdings of limestone in central Penn-

sylvania and plants at Union Furnace and Bellefonte, Pa. The American Company makes a very pure grade of high calcium lime which is largely used in chemical industries. Bellefonte is one of the largest lime shipping centers in the United States.

The Van Sciver Corporation is a long established and equally reliable company, having been engaged in the lime, sand and gravel business in the Pennsylvania-New Jersey District for the past thirty years. The very latest design of all practical equipment is found in the Van Sciver plants, and it has a deserved reputation for keeping its plants in excellent condition. Several of the Van Sciver plants that Charles Warner Company acquired by their recent purchase are immediately adjoining plants owned by the Warner Company.

The Van Sciver holdings which have been transferred to Charles Warner Company include the properties and business of the Hainesport Mining & Transportation Co., Knickerbocker Lime Co., and the Defrain Sand Company, all of which were recently combined by the Van Sciver Corporation.

A facsimile of an advertisement which appeared in a Wilmington newspaper in 1799 and a copy of which hangs in the Warner Offices includes a statement that orders from distant customers "will be promptly attended to and as faithfully executed as if they were present." This assertion forms the very basis of the Warner policy. The constant adherence to this policy, throughout its long term of service, resulted in the success of the organization.

The main office of the Warner Company is now located at 1518 Walnut St. The Delaware Peninsula wholesale sales department and the Wilmington retail accounting department will continue to operate in Wilmington.

A new Corporation to be known as WARNER COMPANY has been organized to take over the plants and equipment of the former Charles Warner Company and the Van Sciver Corporation. The new Company will have lime plants at Knickerbocker, Cedar Hollow and Bridgeport, Pa., extensive deposits of sand and gravel and preparing plants located on the Delaware River below Trenton, fine well-located and modern retail building material yards in Philadelphia and one in Wilmington, Del. In addition, the new Warner Company will control the American Lime and Stone Company. The river fleet of the new Company will include several preparing dredges, tugs and about 180 sand barges. With these resources and equipment, it will be the aim of the new Warner Company to render even better service than in the past.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship, it is going to miss by just that much the pulling power it ought to have.

Fifty years ago the grocer set out a keg of mackerel and a box of kindling wood, and sat down to wait for customers. Today he carries street-car and newspaper advertising and dresses his windows as smartly as the department store. If it didn't pay he'd still be sitting behind the stove waiting for customers with a mackerel keg out front doing service for a sign.

The enormous strides made in public works construction in the United States during the past decade is cited as a significant post-war trend in the survey of the National Bureau of Economic Research shortly to be published with the report of the Committee on Recent Economic Changes of the President's Unemployment Conference.

Figures are given showing that nearly \$1,000,000,000 was expended in 1927 for waterworks, sewers, bridges, streets and roads, excavation, drainage and irrigation by counties, towns, cities, states and the Federal government, whereas less than \$400,000,000 was spent for the same purpose in the year after the close of the war. A comparison of present expenditures with those of the year before the war, when considerably less than \$200,000,000 went for public works is still more striking.

At the end of 1927 upwards of \$5,500,000 had been invested in this class of construction during the post-war period. The Federal government has been spending less in this direction, however, in recent years than it did in the years immediately after the war, the figures show.

The survey of the National Bureau of Economic Research was made at the request of the Committee on Recent Economic Changes following the appointment

of the latter body in January, 1928. The experts of the National Bureau have been since then steadily occupied gathering data for the Committee. The latter concluded its deliberations on March 2. The survey is an exhaustive inquiry into economic trends and changes in the United States during the post-war period. The report, based on the survey, is a critical appraisal of factors of stability and instability in our economic life. The report will be ready for publication in May, it was announced by Edward Eyre Hunt, Secretary of the Committee.

The total annual expenditures by years for public works, as given in the survey follows: In 1913, \$192,893,000; 1919, \$398,152,000; 1920, \$406,729,000; 1921, \$459,042,000; 1922, \$521,079,000; 1923, \$630,424,000; 1924, \$685,673,000; 1925, \$719,212,000; 1926, \$811,741,000; 1927, \$932,703,000.

In the same period, the Federal government's public work expenditures were: 1913, \$41,751,000; 1919, \$72,375,000; 1920, \$36,562,000; 1921, \$28,604,000; 1922, \$43,552,000; 1923, \$47,940,000; 1924, \$38,885,000; 1925, \$34,272,000; 1926, \$50,262,000; 1927, \$50,763,000.

Beginning with 1919 over half of these expenditures have been for roads and streets, which were as follows: In 1913, \$58,407,000; 1919, \$226,655,000; 1920, \$262,641,000; 1921, \$313,303,000; 1922, \$334,694,000; 1923, \$361,837,000; 1924, \$415,216,000; 1925, \$421,039,000; 1926, \$484,898,000; 1927, \$525,069,000.

Data on construction was gathered by the National Bureau's experts under the direction of Dr. John M. Gries, chief of the division of building and housing of the Department of Commerce.

The Committee on Recent Economic Changes is a continuation of the President's Unemployment Conference of 1921 which through a sub-committee on Business Cycles and Unemployment made a report in 1922-23 on booms and depressions also based on a survey by the National Bureau of Economic Research.

The Committee as now constituted is made up of President Hoover, chairman, Walter F. Brown, Renick W. Dunlap, William Green, Julius Klein, John Lawrence, Max Mason, Adolph C. Miller, Lewis E. Pierson, John J. Raskob, A. W. Shaw, Louis J. Taber, Daniel Willard, George McFadden, Clarence M. Woolley, Owen D. Young and Mr. Hunt, Secretary.

The extensive researches in behalf of the Committee were made possible through grants from the Carnegie Corporation of New York and the Laura Spelman Rockefeller Memorial.

The conclusions of the Committee, as well as the survey data will be published for public use.

American
Fire and Marine
Insurance
Company"

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

A Better Service for

BUILDING MATERIALS LIME PRODUCTS SAND AND GRAVEL

THE enlarged Warner Company (formerly Charles Warner Company), has acquired the business and properties of The Van Sciver Corporation.

Instead of wasteful duplication of effort and facilities, the Warner Company by this acquisition, will be able to effect material economies, particularly in the transportation and distribution of Building Supplies in metropolitan Philadelphia.

The enlarged Warner Company will have as its objective the constant betterment of its service and the continuance of the reputation of both predecessor companies for quality products.

Warner Company

THE ORDERLY CHAOS WE CALL BUILDING

*Who Buys the Millions of Pieces of
Material That Are Purchased by
Someone to Build a Forty-
Story Skyscraper?*

BY ALFRED E. FOUNTAIN, JR.

Of Lyddon, Hanford & Kimball, Inc.

At the corner of Thirty-ninth Street and Seventh Avenue, New York, stands a stately building, its steel structure about twelve stories in the air, its white brick and stone shell a few stories lower. So usual is this sight that tens of thousands of people pass it each day without even a glance. But this building is not going up—it is coming down before it is six years old.

Walk a few blocks east to Fifth Avenue and you will see a forty-four story giant rushing toward completion. A thousand men from hundreds of different trades swarm over it. Endless lines of trucks deliver material from daylight to dark. Watch there awhile. Then look up at the sky piercing shaft above you, compute the vast quantities of materials necessary for its construction and wonder how it could all be delivered in an orderly sequence at the required time so as not to inundate the whole neighborhood. While pondering this problem, if you walk around the corner to the other side of the building you will be amazed

to see hundreds of empty trucks drive up and leave for the public dump loaded with refuse material.

Now go with me down the narrow canyon streets of lower Manhattan. A canvas sign fastened on some ramshackle old buildings announces the fact that a giant building is to be erected on the site, to be ready for occupancy on a given date not more than a year away. If you notice the sign and if you think at all you wonder how the thousands of tons of materials literally millions of pieces, many of them especially designed and made to occupy a special place in the completed building, can be moved to the narrow site, not to speak of being erected into place. Then to mystify you the more you will probably read in the next Sunday's paper that several large companies have already leased space in the contemplated building which means that they have accepted someone's assurance that miracles will happen and that they are safe in planning for a new home on a certain date.

Not a Mistake

Two months later, if you again visit the site, you will be sure that somewhere there has been a terrible mistake made. There is absolutely no sign of a building being erected unless perhaps it is to be a new kind of building built underground. For nothing but a gigantic hole greets you, swarming with men and littered with all sorts of useless looking second-hand material in endless chaotic confusion. But let me assure you that no mistake has been made and that many things are happening that you don't see. In a Pennsylvania steel mill twenty nearly exhausted draftsmen are working frantically night and day to complete shop drawings for the steel fabricators to work from. A client of my own won't stop to talk about so unimportant a thing as advertising because he and his entire organization are up to their eyes trying to produce the part of the work that they are responsible for. Out in a New Jersey plant I have seen sculptors at work on models for gigantic ornaments that, hundreds of feet in the air, are to dress the exterior of this new building.

Have no fears. This building will be finished in time. That great shambling giant, the building industry, is following what is to him a well-known course—what is to the layman or even casual student an uncharted labyrinth.

Each year on a larger or smaller scale, the scenes I have just sketched are reenacted in over 190,000 places from one edge of our country to the other. In cities, in suburbs, in small towns, in wild places, in public parks, a half million people, later referred to as owners, are spending over \$7,000,000,000 for new construction. Seemingly each undertaking starts in a confusion that breeds greater confusion as the work progresses, yet all are completed and most prove satisfactory. It is an amazing situation. I am only sorry that space demands that I paint the picture with so narrow a brush.

What's It All About?

I am certain that some time in your life you have been a part of the crowd of onlookers that is always present when a new building is under construction. Have you ever been able to make head or tail as to what the work is all about? Perhaps if you will look upon each new building as what it really is—a great assembling plant for the work of thousands of men in hundreds of factories—you will get a clearer understanding. Considering a building as an assembly plant may also help you in your comprehension of what is to the layman the greatest of all mysteries—how is the estimated cost of a building ever arrived at? As one more inexplicable condition that meets the student of the building industry, I will quote from an article appearing last May in *The Saturday Evening Post* and written by that master builder, Col. W. A. Starrett. He says: "When an industry ranks among the first two or three in a great industrial nation and no one engaged in it makes a living except indirectly, something is wrong. The answer is that building, while conducted with a high technical efficiency, is, economically, the most disorganized major activity known to modern business, agriculture perhaps excepted." Then thinking of new construction only he adds this im-

portant thought: "The customer is a customer, usually only once in his life. He rarely knows anything of building, and arm in arm with this ignorance walks suspicion. His intention is to keep his eyes open, buy as cheap as he can and, having a contract, to depend upon the building laws, the architect's inspection, the iron-clad plans and specifications, a surety bond for competition, and, not least, the fact that he has the money and the whip-hand to force the builder to deliver. Actually he invites the contractor to make what he can."

One could fill this entire book with the seemingly unanswerable mysteries of construction clouded in the confusion of the building industry. Then fill a dozen volumes in the history of the industry showing how these very same problems had been met and answered centuries ago, the answers being part of the heritage of the men trained to build.

But as our interest is more centered on the sale of building materials, rather than their assemblage or erection, we will turn from construction to merchandising and see how that phase of the industry looks. The point I ask you to remember about the construction end of the business is that in spite of the amazing chaos that seems to exist, in spite of the fact that there are few written laws of procedure, in spite of the fact that all is based on tradition, yet all new and untried buildings do get built and are more or less successful in the purpose for which they are built. Common sense tells us that there must be some guiding spirit or method that makes possible the great and beautiful buildings we see everywhere. Does it not seem logical to reason then, that if we can only put our finger exactly on this method and can learn its lesson thoroughly, we can apply what we have learned to the sales and merchandising of building products?

Now suppose we take a quick glance at the numerous and complex problems that face us in our attempt to sell building products on a national scale. For the sake of brevity, I have included under the general head of building products, both structural and decorative materials.

and, to a certain degree furniture, rugs and products that are loosely known as decorative.

If you ask the average manufacturer what constitutes his greatest sales problem he will immediately tell you that is securing proper representation in the field. No manufacturer, no matter what his size or standing, entirely escapes this problem and it is the bane of the company with two or three million dollars annual sale. This trouble is not primarily lack of adequate man-power, but is also due to the fact that many territories will not absorb sufficient goods to pay a good man. The reasons for this may be lack of sufficient preliminary and promotional work, local building slump, local prejudices, local building laws, freight rate handicaps, etc. Given a proved article and proved sales ability, some articles just will not sell profitably in certain sections of this country.

So that when the manufacturer, who has spent a lifetime striving to build a national distribution and knows for a certainty that neither he nor anyone else can accomplish the task, begins to think in terms of national advertising as a sales aid he just can't see how his spotty sales organization and his national advertising are going to function without considerable waste.

Probably right at this point advertising counsel will come into the picture and by research, analysis and persuasion attempt to prove the economics of national advertising. But let the learned counsel beware unless he can thread his way accurately and intelligently through the labyrinth of the entire structure of the building industry. Let him not overlook the mystifying problems of construction; for goods are not sold until they are actually in a building. Let him not overlook the seemingly unsolvable problems of distribution caused by factors too numerous even to mention in this short article. Nor must he forget the mental make-up of his client, the manufacturer—that in the very marrow of this individual's bones is the caution and exactness required by the industry. In building nothing can be taken for granted—theories remain theories until they are proved by actual practice.

But just as successful buildings rise out of the seeming disorder and chaos of building construction, so do successful sales and advertising structures appear from the mysterious entanglements of building-material distribution.

Scientific Marketing is Needed

It is indeed unfortunate that to date these successful advertising campaigns are so few and far between because of the crying need within the industry for the same kind of scientific management in marketing that has been achieved in the field of production. By successful cam-

paigns I mean those that operate without waste and that are otherwise moulded and vamped to meet the requirements of the man who pays for them rather than made to suit the requirements of the council that prepares them.

The point I want to emphasize here is that in spite of the many mystifying problems of distribution, successful building-material advertising campaigns have, are and will be conducted.

Earlier in this article I said that if we could chart out and make articulate the methods and processes that make building construction successful in spite of its apparent handicaps we could apply the answer to the solution of building-material sales problems. The answer is simple in its statement though perhaps hard of comprehension to the lay mind. It is the complete, the inherent understanding that exists between every factor within the industry from the manufacturer, to the contractor, to the architect. It resolves in a co-ordination of effort that accomplishes results in the face of seemingly unsurmountable difficulties. How it comes about I am not exactly certain. Building is an age-old industry in which people have accumulated more or less expert knowledge through long periods of time. It is fraught with much of tradition and conservatism. People in the industry are in it because of a temperamental affinity for it. Once in it they absorb its customs and habits and laws until they function with a unity of purpose based on an understanding of one another's problems.

The three factors whose co-ordinated functioning bring order to construction programs are the architect who creates, the contractor who organizes and constructs, and the manufacturer who produces the materials. This triumvirate who often never see each other, follow customs and unwritten laws and produce successful buildings.

Turning to the sales side of our story we find a new line up of three (and sometimes four) factors that control every purchase of material made in the building industry. It consists of owner, architect and contractor, and in some cases the dealer or jobber. No sale of building material is ever made unless one of these three is at the buying end. Therefore as no building is ever built that does not have either an owner, architect or contractor connected with it but usually has all three, it is quite evident that no sale ever will be consummated unless one or all three are sold.*

*The writer fully realizes the importance of the dealer or jobber in the distribution of many lines of building materials but for the sake of brevity and clarity in this article he feels justified in treating him as a sales aid rather than a buying resistance.

It therefore becomes immediately apparent that economic advertising calls for a direct appeal to all three of those buying powers. And when you get right down to the job of analyzing how this can best be done you will be amazed at the simplicity and ease of the undertaking. You will find a situation the like of which, I believe, exists in no other industry. You will find that having sold the architect and contractor you have sold not 66 2-3 per cent. of the purchasing power of the industry but 80 per cent. of it.

You will find that you can sell these factors without waste of money, time or effort. You will also find that in advertising to the owner, or consumer if you prefer, that he too can in most cases be so analyzed and segregated as to eliminate most of the waste and guess from your effort.

The same precision and orderly sequence that prevails in the construction end of building prevails in its sales end. You will never realize this from standing off and looking at it. From the outside a building is a confused chaos of derricks, trucks, dealers, steam drills, architects, lumber, cement, owners, contractors, without head or tail. On the inside you see an orderly co-operation between a group of individuals who know exactly what they are about. And to the seller of building materials the most interesting part of the entire situation is the fact that the three to four billion dollar purchasing power of the industry lies entirely in the hands of a relatively few thousand men.

WHY ADVERTISE?

Among the questions put and answered by one of the advertising experts during Ceramics Week in Chicago, was why advertise when plants are running full? The answer is to prevent loss of trade to others and the slowing down of business at some near future date. The speaker in this case made his point that advertising and publicity are essential to progress along with research work if we are to harvest the results of our efforts in the future as we should. This is not only a good line of reasoning for the producers of clay products, but it applies equally well to the machinery and equipment men. All recognize and harken to the call to advertise when business is slow and more orders are needed, and most all are inclined to let up on advertising when business is good and orders are fairly plentiful. This is natural but it is not logical. Sound logic points the need for continued advertising that we may have continued prosperity. And this applies to machinery and equipment folks as well as to producers of clay products—*The Clay-Worker*.

BUILD WITH LESS RISK

Insurance, of one kind or another, has gradually made building a less hazardous business.

Now, the risk of loss by fire while a structure is in course of erection is assumed by a "Builder's Risk Policy."

Builders are invited to consult with North America Agents on the coverage that this insurance provides; its cost, and other details, without obligation.

Insurance Company of North America

A Better Service for

**BUILDING MATERIALS
LIME PRODUCTS
SAND AND GRAVEL**

THE enlarged Warner Company (formerly Charles Warner Company), has acquired the business and properties of The Van Sciver Corporation.

Instead of wasteful duplication of effort and facilities, the Warner Company by this acquisition, will be able to effect material economies, particularly in the transportation and distribution of Building Supplies in metropolitan Philadelphia.

The enlarged Warner Company will have as its objective the constant betterment of its service and the continuance of the reputation of both predecessor companies for quality products.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Residences (2), \$22,000. 712-14 Blackshire street, Wilmington, Del. Owner will build. Architect, private plans. Owner, C. W. Gooding, Jr., 2310 Ridgeway road, Wilmington, Del. Stone, brick, 2½ stories, 22x35 feet, slate roof, hardwood floors, hot water heat, electric light, metal lath.

Residence, \$14,000. 812 Blackshire street, Wilmington, Del. Owner will build. Owner, Charles W. Gooding, 2310 Ridgeway road, Wilmington, Del. Stone, 2½ stories, 25x47 feet, slate roof, hardwood floors, electric light, hot water heat, tile work.

Residences (5), \$25,000. 2801 03-05-07-09 West street, Wilmington, Del. Owner will build. Owner, Bernard Tophis, 833 West Nineteenth street, Wilmington, Del. Brick, 2 stories, 20x29 feet, composition roof, pine floors, hot water heat, electric light.

Residences, \$70,000, North side Thirty-fifth street, Wilmington, Del. Owner will build. Owner, Harry B. Roos, 2109 Franklin street, Wilmington, Del. Brick, 2 stories, 20x31 feet, slatt and slag roof, hardwood and pine floors, hot water heat, electric light, tile work.

Many a man would do a better job if he didn't know about putty.—Ex.

Miscellaneous Contracts Awarded

Junior and Senior High School, Milford, Del. Contract awarded J. B. Ferguson & Co., Hagerstown, Md., \$141,000. Electric, Electric Service Co., 706 West Fourth street, Wilmington, Del., \$3,660. Heating and ventilating, Palmer-Thackery Co., Rehoboth, Del., \$23,000. Plumbing, Prichett & Robbins, Cambridge, Md., \$13,860. Architects, Guilbert & Betelle, Chamber of Commerce Building, Newark, N. J. Owners, State School Building Commission, Dr. H. V. Holloway, superintendent, Dover, Del. Brick, concrete, steel, 3 stories and basement, 152x73 feet, limestone, iron stairs, maple and yellow pine floors, integral waterproofing. Low bidders: J. B. Ferguson & Co., Hagerstown, Md., \$131,000.

School, Rose Hill, Del. Contract awarded Dominic Fontana, 814 West Fourth street, Wilmington, Del. Heating, plumbing and ventilating, T. T. Weldin & Son, 916 Orange street, Wilmington, Del. Electric, Electric Contracting Co., 111 West Eighth street, Wilmington, Del. Architects, Guilbert & Betelle, Chamber of Commerce, Newark, N. J. Owners, State School Building Commission, Dr. H. V. Holloway, superintendent, County Building, Wilmington, Del. Brick, concrete, timber, 1 story, 153x77 feet, steel, iron, carpentry.

Residence and Garage, Westover Hills, Wilmington, Del. Contract awarded Smyth Construction Co., 1415 Clinton street, Wilmington, Del. Architect, A. Burton Stanhope, Equitable Building, Wilmington, Del. Owner, Dr. James W. Lowrie, Wilmington, Del. Stone, steel, 2½ stories and basement, 71x47 feet, 33x22 feet, slate roof, oak, pine and cement floors, metal lath, tile, bond, ornamental iron.

Knitting Mills, Frederick, Md. Contract awarded Hahn & Betson, Frederick, Md. Architects, Lockwood-Greene Co., 100 East Forty-second street, New York City. Owners, Union Manufacturing Co., Frederick, Md. Brick, steel, limestone, 1 story, 100x100 feet, built-up roof, cement floors, hollow tile, rolled steel sash, floor hardener, iron work.

Sunday School (add.), Hagerstown, Md. Contract awarded George N. MacWolf, Hagerstown, Md. Architects, Bureau of Architects, Methodist Episcopal Church, 1701 Arch street, Philadelphia. Owners, Church of the Brethren, Rev. A. B. Miller, Hagerstown, Md. Brick, stone, 3 stories.

MAKING COLOR ADD TO SALES VALUE

Painting of Wood and Stucco Adds the
Modern Touch That Catches the Eye

BY MARIE HULSER

Houses, like people, are often judged at their face value. A prospective home owner is much more impressed by the exterior appearance of a house than by any

other feature. If it makes a good impression at first sight he will be favorably inclined—if it doesn't chances are that all the modern interior improvements devised to intrigue him, once he is on the inside, will have no effect whatsoever.

A person wants, first of all, when buying a house, one that is not only "different" in type and lines, but cheerful and harmonious in its colorfulness. He wants a home to be proud of, rather than one that has everything else, but misses being attractive because of an ill chosen color scheme—or a drabness due to an utter lack of color.

The more practical aspects of home buying will follow. But, first it is the color that takes the eye, and practically makes the sale—much more than the style of a house or its practicability.

Color is very much the vogue, at the present time, both inside and outside of the home. But by color we do not mean an ensemble of flaunting reds and flagrant purples for exterior decoration. Merely a slight departure from the conventional tones—something that gives a place some unusualness—an individual appearance.

Colonial yellow is being used a great deal now in place of the usual white on Colonial homes—stone gray to make a lovely substitute with sage green trim—or a gray trim of a lighter shade than the body color. New color, if only to replace the usual dark green of shutters has done a lot toward individualizing many of the modern homes. Various shades of blue, if in harmony with the alternating colors, are most attractive for shutters. A definite departure from the conventional, in this way, can result in an altogether charming and effective color scheme.

If certain factors are considered and a choice is made accordingly the builder need feel no hesitancy in embarking on colorful schemes for his houses. First the architecture of a house and its location must be considered. It is wisest to adapt the color scheme to the period of a house, as much as possible. For instance, the strong contrasts of deep brown, light buff, and red brick, while appropriate for an English half-timbered design, would be more suitable here than on a Dutch Colonial house. And colors suitable for a Georgian house might not be adaptable for a Colonial farm-house.

IRON WORK THAT STANDS INSPECTION

BUILDERS' Iron, Stairs, Railings, Etc. Wrought Iron

PARK 4147-4148

A house will always look its best when its colors are blended into its background and surroundings. The roof must be considered and included in the choice of colors.

Painting and decorating stucco has become equally as popular as the use of color on frame houses. The more conservative houses are being painted a lovely light gray, using a darker tone for the trim, and a tile-red roof. Most of the dwellings which are Italian in design are built of stucco. These are made much more attractive when painted a soft salmon pink—suggesting an Italian villa.

The use of paint on stucco is one of the greatest assets to such a dwelling. The appeal of stucco is greatly lessened if it is left without color. At the same time this material, if allowed to remain unpainted, absorbs soot and cinders, which are not easily removed. This inevitable occurrence results in a most depressing looking place.

Stencil decoration in color is frequently used on stucco houses, executed either in a single contrasting color or in a variety of colors. For instance, the beauty of an arched entrance to a light cream stucco bungalow, would be very much enhanced with a narrow stencil border applied directly over the stucco with paint. Dark brown and deep tan would be extremely attractive colors for conservative decoration. Red and green in a floral pattern, if not too brilliant, would be even more effective.

A well planned design will give relief and character to exterior wall areas that might otherwise be too severe. Stencil decoration, used to alleviate such structural unattractiveness, will enable an appreciable saving in building costs, eliminating the need for reconstruction.

In addition paint on stucco gives the same protective qualities it supplies a wooden or shingled exterior. It keeps out moisture which is damaging, it preserves the surface from the heat of the sun or from a driving rain by affording unequalled preservation.

Too much cannot be said, at this time, about the value of a good paint job. In choosing paint colors a builder should also be assured that the paint to do the work is of the best quality, not only because such paint will be eminently more effective in its beauty work, but because it will give the necessary protection expected of it. It must be applied by painters who know their job, thus affording the house the opportunity to serve as a lasting monument to the builder both through the use of good materials and good workmanship.

A good color scheme will add dollars to the sales value of a house, and if the materials and workmanship used are first class, the paint that is doing this work can insure the resale value and the reputation of the builder.

Well painted houses, in discriminating colors, in addition have a great deal to do with improving the valuation of a neighborhood. And a good looking neighborhood attracts residents to it with little effort on the part of the promoter. "An attractive home in a nice neighborhood" is the ambition of every up and coming family. Colorful homes sell themselves. —*Building Age and National Builder.*

THE CONSTRUCTION SURVEY CONTRACT

BY G. SZMAK, *Economist*

A good deal has been said and written about the irresponsible buyer and seller of construction. This fact not only indicates a problem, but also the urgent need of a solution. While it is impossible to entirely eliminate unfair practices, yet, it is very easy to increase fairness by encouragement. Catch phrases, slogans and co-operative movements to improve ethics, however, do not increase fairness while inefficient or degenerated methods of transacting business remain in use.

Thru research in the field of contracting better methods are continually being developed to improve the equity between buyer and seller. This advance is made by utilizing the merits and scraping the demerits of the present forms of contract.

Although used extensively, it is continually proven by fact that lump-sum contracts do not protect either buyer or seller. Which one gains or loses is a matter of more or less conscience as the information upon which lump-sum contracts are usually based is not sufficiently positive to afford full protection. Thus extras are the rule rather than the exception under this form of contract.

The cost plus contract is another form that has been used by some of the larger buyers of construction. This method has at least one distinct advantage. It eliminates the entire risk of the seller while the buyer assumes payment for all material and labor required to erect the structure plus a definite percentage fee for contractor's management and profit. The seller's risk having been eliminated, the contractor is free to concentrate upon producing a good piece of work. Unfortunately, or otherwise, not every buyer is willing or can afford to pay for construction at an indefinite price.

A third and more recent form is the construction survey contract which is universal for the reason that it eliminates the risk of both buyer and seller. This form of contract is based upon a construction survey which reveals in advance the exact quantity, quality and price of each part of the structure so that the entire transaction is open for examination at all times. Under this method the buyer is enabled to know precisely the cost of each item in advance, compare the cost

of a certain item by different bidders and also the cost of one item against another to determine the most economical construction that is suitable.

The total actual cost of the project is determined more positively under this method than any other because every survey contract is supported by a preliminary estimate prepared by the construction surveyor as well as by the contractors' final estimates.

PLUMBING IN SKYSCRAPPERS STUDIED BY GOVERNMENT EXPERTS

Many Additions to Existing Code Recommended in Report Just Issued by Department of Commerce

One of the outstanding problems involved in the construction of the modern skyscraper—that of adequate and sanitary plumbing—bids fair to be solved as a result of investigations of the Commerce Department's Committee on Plumbing, working in conjunction with government scientists. This analysis of plumbing in high buildings is supplementary to a study made several years ago in connection with installations in dwellings and small buildings.

In a report which has just been released such questions are discussed as the size of pipe to be used, kind of venting, most efficient and sanitary types of traps, etc. The conclusions arrived at, it is pointed out, are based on tests made by experts of the Bureau of Standards and experience with actual plumbing installations. Buildings from 10 stories to 40 stories above the ground present many plumbing problems not found in smaller structures. For this reason, the Committee overhauled its earlier report, strengthened it where the need was disclosed, and added tables and rules suitable for the design of high plumbing systems.

The committee states that although its present recommendations are a step forward toward more logical and economical requirements and are believed to be the best that can be offered in the present state of knowledge, much experimental work remains to be done before all phases of the subject will be thoroughly understood. It urges the continuation of experimental work in the belief that the public will benefit greatly from it.

Copies of the complete report which is entitled "Minimum Requirements for Plumbing" may be obtained for 35 cents from the Superintendent of Documents, Washington, D. C.

That plan of the king in olden times who killed the messenger who brought him bad news has my approval. Blessed are those who bring glad tidings! If you cannot write a good letter—don't!—*Elbert Hubbard.*

"ANTI-HYDRO" Keeps These Cellars Permanently Dry

One of a Group of Houses at Malba Estate
Malba, Long Island, N. Y.

Architect, Harold E. Padden
Contractor, Arthur Waldron

The houses at Malba Estate are built on "springy" ground, but the cellars of all of them are always dry, because the concrete foundations, walls and floors are permanently waterproofed with "ANTI-HYDRO."

No matter how large or small your job may be, you will find "ANTI-HYDRO" the most satisfactory as well as the most economical concrete waterproofer and hardener you can use. It both hardens and waterproofs in *one operation*.

"ANTI-HYDRO" is a liquid integral compound which mixes easily with the gauging water—any unskilled laborer can do it. Twenty-five years of successful use is your guarantee of satisfaction when you use "ANTI-HYDRO." Try it on your next job for permanence.

THE enlarged Warner Company (formerly Charles Warner Company), has acquired the business and properties of The Van Sciver Corporation.

Instead of wasteful duplication of effort and facilities, the Warner Company by this acquisition, will be able to effect material economies, particularly in the transportation and distribution of Building Supplies in metropolitan Philadelphia.

The enlarged Warner Company will have as its objective the constant betterment of its service and the continuance of the reputation of both predecessor companies for quality products.

MULTIPLY MAN POWER WITH A CROWE SAFETY SAW

Men like to use a Crowe Safety Saw. One man with a Crowe can do as much work as ten men with ordinary saws, or two men with other portable electric saws. And it takes that hard grind out of the work.

Every day men are demonstrating its utility and their preference for it. Made of aluminum alloy, they carry it to the lumber, plug into a light socket, and the G. E. motor drives it through the lumber in record-breaking time.

All Crowe saw blades are standard and interchangeable—cross cut, rip or combination blade. Absolutely no danger to the operator. Saw is guaranteed against defects in material or workmanship.

Ask us about our time payment plan. Perhaps you can let the saw pay for itself.

Write for further information. Two cents invested now will bring you big dividends later. Slip that inquiry in the mail today.

"CROWE SAFETY SAW"
CUTS THE COST

Crowe Safety Saws are patented. Equipped with ball bearings throughout. General Electric motors and Ingersoll-Rand motors used. Any type of blade supplied as ordered. Cutting line is always in sight.

THE CROWE SAFETY SAW
SALES CORPORATION
of Pennsylvania
515 Real Estate Trust Building
PHILADELPHIA, PA.
Telephone—Pennypacker 6420

CROWE MANUFACTURING CORPORATION
317-321 Sycamore Street, Cincinnati, Ohio
Dealers in all principal cities

You can buy the Crowe Safety Saw in four different sizes, giving you a wide range of efficiency.

For those jobs where electricity is not available, a Crowe Air-Driven Safety Saw has been built. It has all the excellent qualities of the electrically driven saw.

If you cut lumber on the job, a Crowe Safety Saw will do the work in less time than any saw you've seen.

Officially approved for safety by industrial commissions, listed as standard by Underwriters' Laboratories, and recommended by insurance companies.

Cuts up to 6 1/8 inches. Made in four sizes.
